

Introduction to Electromagnetic Compatibility Engineering Solutions

CEE 451 – MidTerm II Exam

1. (a) Why do you think the antenna of an EMI receiver is moved 1 m to 4 m vertically during the RE measurements?
 (b) Which currents cause more EMC problems; CM or DM, when and why? (c) How can one believe/trust the result of an EMC test/measurement?

(a) The standards cover a wide frequency range; hence, resizing the dipole for every frequency would be a very time-consuming task. In order to speed the measurement over a wide frequency band, the receiver is swept across the band and the radiated electric field at each frequency is automatically recorded.(page 66 from text book)

(b)

Typically, the common-mode currents will be substantially smaller than the differential-mode currents. Common-mode currents are not inconsequential in typical products, and, moreover, they often produce larger radiated emissions than do the differential mode currents.

Observe that because the differential-mode currents are equal in magnitude but oppositely directed, the radiated electric fields will also be oppositely directed, and will tend to cancel. They will not exactly cancel, since the wires are not collocated, so the net electric field E_D will be the difference between these emission components. The common-mode currents are directed in the same direction, their radiated electric field components will add, producing a net radiated electric field E_C .

$$|\hat{E}_{D, \max}| = 1.316 \times 10^{-14} \frac{|\hat{i}_D| f^2 A}{d}$$

$$|\hat{E}_{C, \max}| = 1.257 \times 10^{-6} \frac{|\hat{i}_C| f^2 \mathcal{L}}{d}$$

Due to the magnitude of the electric field, CM radiation is much more of an emission problem than DM radiation. To minimize CM radiation, common current must be reduced to zero by means of a sensible grounding scheme. From this formulas we can predict that at high frequencies DM currents will cause more problems because of f^2 and we see at low frequencies even the smallest CM current will much more effective than DM currents with same magnitudes.

(c) The key word for this is 'Accreditation'. You should prove this with certificates and show that you are recognized and qualified in that area. Every customer don't have a knowledge about EMC and test qualifications therefore they may ask you if you have a specific certificate. Device which is going to be measured should be calibrated. Measurement tools should be trustworthy. Environment should suppress all other emissions and just the device's emissions should be measured. Tests should be done as it stated in standards.
