Hormonal and Neuroendocrine Regulation of Energy Balance Maria Moreno, Antonia Lanni, 2016-07-18 Alteration in adequate energy balance maintenance results in serious disturbances such as obesity and its related metabolic disorders In Mammals energy balance is homeostatically controlled through hormonal and neuroendocrine systems which cooperation is based on cross talk between central and peripheral signals The hypothalamus as well as peripheral hormones among which adipokines from adipose tissue and thyroid hormones play a crucial role in energy homeostasis Unraveling the physiological cellular and molecular mechanisms through which hormonal and neuroendocrine systems regulate energy balance has been a long standing challenge in biology and is now more necessary when considering the world wide increasing prevalence of obesity Indeed recognizing and understanding the biochemical and nutrient signaling pathways contributing to the nervous and endocrine integration of physiological mechanisms involved in the normal and or abnormal regulation of energy balance is fundamental also to the development of new effective and targeted treatments for obesity Recent studies have highlighted the role of hypothalamic pro opiomelanocortin expressing neurons in the regulation of energy homeostasis by controlling energy expenditure and food intake This is accomplished through a precise balance of production and degradation of a melanocyte stimulating hormone an anorexigenic neuropeptide which is degraded to an inactive form unable to inhibit food intake by the key enzyme prolyl carboxypeptidase PRCP thus suggesting that pharmacologic approaches targeting PRCP may provide a novel and effective option for the management of obesity and its associated metabolic disorders Indeed efforts have been made to generate potent brain penetrant PRCP inhibitors Weight loss due to negative energy balance is a goal for obese subjects not always reachable by dietary caloric restriction or increased physical activity Lipid lowering therapies have been suggested to have potential benefits however the establishment of comprehensive therapeutic strategies is still awaited Recently it has been reported that thyroid hormone TH derivatives such as 3,5 diiodothyronine and 3 iodothyronamine possess interesting biological activities opening new perspectives in thyroid physiology and TH derivatives therapeutic usage Moreover several studies focusing on the interaction between thyroid hormone TH the autonomic nervous system and the liver revealed an important role for the hypothalamus in the differential effects of TH on autonomic outflow to peripheral organs controlling energy balance This Research Topic aims to give a comprehensive and integrate view of the factors involved in the endocrine and neuroendocrine signaling in energy balance regulation to highlight their involvement into
