Chapter 1

Practical investigation 1.1: Estimating measurements

Getting started

Measurement	Equipment
length	ruler
volume	measuring cylinder, ruler, beaker
mass	balance
time	timer, stopwatch

Answers to workbook questions

- 1 Learners should record their results in the table.
- 2 Learners should check that all measurements are to the correct number of significant figures.
- 3 Learners calculate average values for each measurement.
- 4 Learners comment on their estimated and measured results. They should make reference to the limits of accuracy of the measuring equipment.
- 5 Learners calculate the volume of the glass block, based on their measurements using rulers.
- 6 A pair of vernier callipers would give a more precise result than a ruler. This increased degree of accuracy would then be carried into the calculation. Learners suggest alternative methods of measurement.
- 7 30 cm ruler precision is correct to 1 mm; metre ruler precision is correct to 1 mm; stopwatch precision is correct to 0.01 s.

Practical investigation 1.2: The simple pendulum

Getting started

For a short time frame, measure over multiple oscillations, for example, ten, and record the time for this. The reaction time for a human is approximately 0.4 s. This would affect the time if done for one oscillation. Use a fiducial marker to be able to take time from a consistent point.

Answers to workbook questions

- 1 Learners record their results in the table.
- 2 Learners calculate the time period for each length of pendulum by dividing their time period for ten oscillations by 10.
- 3 Learners draw their graphs, with length on the horizontal axis and time period on the vertical axis, to produce a roughly horizontal line.
- 4 Results should show that as the length of the pendulum increases, the time period of the swing increases.
- 5 The mass of the pendulum may have an effect or the type of material from which the pendulum is made.

Practical investigation 1.3: Calculating the density of liquids

Getting started

Density of a fluid can help to tell whether an object will float. This is important in relation to aerospace and shipping.

Volume of fluid: 45 cm³, 72 cm³, 7 cm³.
