Crustacean Reproductive Physiology and its Applications Haihui Ye, Chaoshu Zeng, Naoaki Tsutsui, Heinrich Dirksen, 2022-09-27 Demand for crustacean production is increasing significantly throughout the world and crustacean production from capture fisheries has almost stagnated. Aquaculture is the only possibility to meet this ever growing demand for crustaceans. Still many commercially important crustaceans are being captured from the wild while breeding and seed production technologies are not available for these species. The bottleneck in the successful breeding of crustacean species is mainly due to the non availability of information about reproductive biology. Studies on crustacean reproduction will shed new light on understanding the mechanism of sex determination and differentiation meanwhile the application of innovative techniques will vitally contribute to the progress of the crustacean industry. The research findings on crustacean reproduction will directly benefit aquaculture for successful captive breeding and seed production. Here we are gathering both original research and review papers with the scope of the research topic including but not limited to Mechanism of sex determination, sexual differentiation and gonadal development in crustaceans. Other life functions e.g. endocrine, nutrition, immunity, heredity involved in reproduction in crustaceans. Applications of modern endocrinological and molecular approaches contributed to crustacean reproduction. *Metabolism of herbs/natural products and pharmacodynamic or toxic mechanisms* Qi Wang, Bingyou Yang, Longlong Si, Shuai Ji, 2023-03-03

Opportunistic pathogens: pathogenesis and multi-drug resistance mechanisms Shicheng Chen, Lisheng Liao, Mingxi Wang, 2025-04-17

The World Health Organization (WHO) has identified antimicrobial resistance (AMR) as one of the most critical global public health threats. At least 4.95 million people death was caused by AMR in 2019. Even worse its potential economic impact is estimated to reach a staggering 100 trillion due to AMR in the next thirty years. <https://www.who.int/health-topics/antimicrobial-resistance>

Researching the development of antibiotic resistance and exploring ways to prevent, detect and treat antimicrobial resistant infections have been prioritized in the medical microbiology field. AMR mechanisms have been uncovered on many Enterobacteriaceae and Gram positive bacteria such as *Enterococcus faecium* and *Staphylococcus aureus* due to their clinical significance and diverse resistance mechanisms. Unfortunately the opportunistic pathogens have been overlooked in the clinics because they are often identified as normal flora or common environmental organisms in human specimens. Opportunistic pathogens may have low pathogenicity while they can often cause serious infections in immunocompromised patients and lead to outbreak in the healthcare settings. They may even lead to diseases in healthy individuals if being introduced into hosts system by traumatization. Management of such infections is often challenging due to the lack of guidelines, standards for antibiotic susceptibility tests as well as multi drug resistance (MDR). Lately diseases linked to non pathogenic microorganisms are becoming more common under typical conditions such as *Stenotrophomonas maltophilia*.

genomics and sequencing platforms have accelerated the understanding of how candidate genes contribute to the development of immunological disorders Significant progress has been made in discovering disease causing genes for rare monogenic immunological disorders especially in immunodeficiency syndrome These findings shed insights into disease mechanisms and facilitated the identification of new biomarkers that can help in diagnosis prognosis and development of novel clinical therapeutic approaches
