Optimal operation, configuration and sizing of energy storage and energy conversion technologies for residential house energy systems Tobias Alexander Beck , 2020-06-23 In recent years a rapid growth in the interest in self consumption of electricity generated by distributed electricity generation technologies such as rooftop photovoltaic PV systems has been observed in the residential sector Due to this development future residential house energy systems will face an increased complexity with respect to operation system configuration and sizing of generation and storage technologies In this thesis a mixed integer linear programming model for the integrated operation configuration and sizing of house energy systems is developed and discussed with respect to its applicability to the specifics of self consumption in residential dwellings The conducted scenario analysis shows that over a wide range of assumptions PV is a robust measure to decrease the total cost of ownership for heat pump and gas boiler based house energy systems The existence of a feed in tariff and the electricity price structure have a much larger influence on the results than the energy price development A feed in tariff generally incentivizes larger PV systems with higher levels of self sufficiency

whereas small demand driven PV systems with high levels of self consumption are favored in absence of a feed in tariff Overall the proposed model is regarded as applicable for the identified minimum flexibility requirements for the employed generation technologies The results from the scenario computations provide a clear and robust picture of the role of electricity generation technologies and flexibility options for future house energy systems
