

Silent Sound Technology

Abstract

Silent Sound Technology for mandarin is a non-speech interaction embedded engine with a variety of lip movement and facial expression interactive service platform based on cloud computing. This technology helps people to communicate in noisy places and to reduce noise pollution to some extent. If we don't communicate...!! As a result of being unable to communicate is a withdrawal from many of the social activities. An attempt is made to develop a mobile terminal oriented integration of a variety of interactive way emotional speech interaction system just to put an end for embracing situation like when a person need to convey that "I can't talk to you right now" or apologetically rushing out of the place along with the device to answer and so on.. A high resolution camera is used to capture the video of human silent speech and is morphologically segmented for noise. From the binary image frames the lip montage is built to generate a threshold value for every word in sequence and a database is created for all known templates. After the threshold test pass, other facial parts like eyes with eye brows and nose are mapped with the data base contents to obtain emotional expression and finally, user can receive text messages in sequence as well as audio output. Initial results obtained are discussed in this paper.
