David Robert Stauffer, Jeanne Trinko Mechler, Michael A. Sorna, Kent Dramstad, Clarence Rosser Ogilvie, Amanullah
Mohammad, James Donald Rockrohr, 2008-12-19 The simplest method of transferring data through the inputs or outputs of a
silicon chip is to directly connect each bit of the datapath from one chip to the next chip Once upon a time this was an
acceptable approach However one aspect and perhaps the only aspect of chip design which has not changed during the
career of the authors is Moore's Law which has dictated substantial increases in the number of circuits that can be
manufactured on a chip The pin densities of chip packaging technologies have not increased at the same pace as has silicon
density and this has led to a prevalence of High Speed Serdes HSS devices as an inherent part of almost any chip design HSS
devices are the dominant form of input output for many if not most high integration chips moving serial data between chips
at speeds up to 10 Gbps and beyond Chip designers with a background in digital logic design tend to view HSS devices as
simply complex digital input output cells This view ignores the complexity associated with serially moving billions of bits of
data per second At these data rates the assumptions associated with digital signals break down and analog factors demand
consideration The chip designer who oversimplifies the problem does so at his or her own peril **Official Gazette of the**
