

Translation Handout AP Biology

Name: Alexander Yara

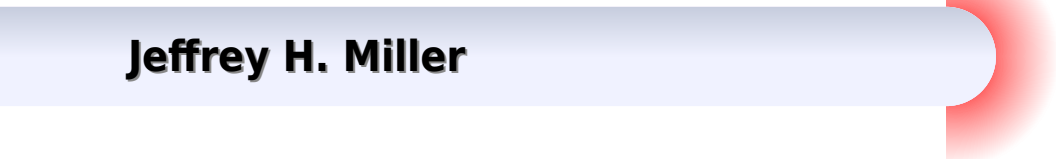

The diagram below shows the translation phase of protein synthesis. The diagram shows how a single mRNA molecule can be 'serviced' by many ribosomes at the same time. The ribosome to the right is in a more advanced stage of constructing a polypeptide chain because it has 'translated' more of the mRNA than the ribosome to the left. The anti-codon at the base of each tRNA must make a perfect complementary match with the codon on the mRNA before the amino acid is released. Once released, the amino acid is added to the growing polypeptide chain by enzymes.

Ribosomes are made up of a complex of ribosomal RNA (rRNA) and proteins. They exist as two separate sub-units until they are attracted to a binding site on the mRNA molecule, where they join.
