Optimal operation, configuration and sizing of energy storage and energy conversion technologies for residential house energy systems Tobias Alexander Beck , 2020-06-23 In recent years a rapid growth in the interest in self consumption of electricity generated by distributed electricity generation technologies such as rooftop photovoltaic PV systems has been observed in the residential sector Due to this development future residential house energy systems will face an increased complexity with respect to operation system configuration and sizing of generation and storage technologies In this thesis a mixed integer linear programming model for the integrated operation configuration and sizing of house energy systems is developed and discussed with respect to its applicability to the specifics of self consumption in residential dwellings The conducted scenario analysis shows that over a wide range of assumptions PV is a robust measure to decrease the total cost of ownership for heat pump and gas boiler based house energy systems The existence of a feed in tariff and the electricity price structure have a much larger influence on the results than the energy price development A feed in tariff generally incentivizes larger PV systems with higher levels of self sufficiency

whereas small demand driven PV systems with high levels of self consumption are favored in absence of a feed in tariff Overall the proposed model is regarded as applicable for the identified minimum flexibility requirements for the employed generation technologies The results from the scenario computations provide a clear and robust picture of the role of electricity generation technologies and flexibility options for future house energy systems *IBM Virtual Disk System Quickstart Guide* Sangam Racherla,Jure Arzenšek,Jamal Boudi,Dharmesh Kamdar, Van Tran, IBM Redbooks, 2010-02-17 This IBM Redbooks publication is a quickstart guide for implementing an IBM virtual disk system We use the term IBM virtual disk system to collectively refer to IBM SAN Volume Controller SVC System Storage Productivity Center SSPC IBM mid range storage DS3400 in this case and IBM Brocade SAN Switches IBM System Storage SAN Volume Controller SVC is a virtualization appliance solution that maps virtualized volumes visible to hosts and applications to physical volumes on storage devices The IBM virtualization technology improves management of information at the block level in a network enabling applications and servers to share storage devices on a network With IBM System Storage Productivity Center SSPC™ administrators can manage storage along with the other devices in the storage environment This greatly simplifies management of even the most basic storage environments and the awareness of environment helps to reduce accidental errors that can cause downtime SSPC comes preloaded with IBM Tivoli Storage Productivity Center products enables end to end disk management on single screen and supports management of heterogeneous systems and devices **Windows 2000 Performance Guide** Mark Friedman, Odysseas Pentakalos, 2002 For repairing performance loss or maximizing current potential this guide aims to provide the information and conceptual framework that will enable readers to be performance experts Includes information on processor performance application profiling and hardware considerations
