Eruption entices volcano viewers

By Dorothea Blythe

Yesterday evening, a volcano that had been lying dormant for over 8,000 years erupted in Iceland. Fagradalsfjall volcano is situated around 40 kilometres outside of the capital city, Reykjavik. The nonexplosive eruption began on Friday evening, when lava burst through a crack in the mountain. The site has been flooded with visitors, desperate to see the location.

Making this occurrence even more exciting was its location. The peninsula is popular to travellers visiting Iceland and is home to Blue Lagoon. A local tourist agent said, "It is the most accessible eruption in the world. It is an opportunity to see an eruption in nature."

Volcanic eruptions are common in the area, although they have never been seen quite as fascinating as this. The magma has emerged from deep within the Earth's crust. In fact, around 200,000 cubic metres of lava have poured out. Some of the lava also spurted from the top of the volcano as it began erupting.

According to geologists, scientists that study the physical structure of the Earth, nonexplosive eruptions are common in the area, although they have never been seen quite as fascinating as this. The magma has emerged from deep within the Earth's crust. In fact, around 200,000 cubic metres of lava have poured out. Some of the lava also spurted from the top of the volcano as it began erupting.

Initially, it reached a towering height of 40 metres. The eruption was small and managed by specialists, so no one was hurt. However, it could have been disastrous.

Volunteers were prepared for the eruption because there have been more than 50,000 recent earthquakes in the area. Since this afternoon, scientists who brought a range of specialist equipment have been keeping track of the volcano's activity.
