Horizontal Gene Transfer Mediated Multidrug Resistance: A Global Crisis, 2nd Edition Dongchang Sun, Katy Jeannot, Yonghong Xiao, Charles W. Knapp, 2020-07-16 Throughout history human life has been seriously threatened by bacterial infectious diseases After the discovery of antibiotics humanity thought it had won the fight against infectious bacteria However considering the rapid evolution of bacterial multidrug resistance and exhausted pipeline of antibiotics for fighting bacterial infectious diseases we are approaching the post antibiotic era Unlike eukaryote bacteria are proficient in exchanging their genetic materials with others by means of horizontal gene transfer HGT As a vehicle for antibiotic resistance gene ARG plasmid is self replicable and transferable in a wide range of host bacteria Moreover ways of HGT mediated ARGs spreading are highly diverse among different species implicating complex evolution routes for the development of multidrug resistance in bacteria In recent years multidrug resistance plasmids have been widely found in bacteria not only from clinical patients but also from animals birds and plants as well as from natural environmental settings including soil and water heralding that the post antibiotic era is much closer than we previously thought The global crisis of multidrug resistance calls for a closer collaboration among people of different professions in different regions countries and continents which will help us recognize the current situation and eventually find effective and long lasting solutions for fighting against infectious bacteria

Navon-Venezia, 2021-01-20 Antimicrobial resistance AMR is a global problem with extremely complex epidemiology involving the direct and indirect transmission of antibiotic resistant pathogens and mobile genetic elements between humans animals and the environment AMR is therefore recognized as a One Health issue Data that describe AMR prevalence and trends are required to enable the judicious and prudent use of antimicrobials in animals which has implications both from veterinary and animal welfare aspects as well as from a zoonotic and public health perspective Horses are a potential reservoir of AMR for humans due to close human animal contact as was demonstrated with shared human and horse methicillin resistant *Staphylococcus aureus* MRSA strains causing outbreaks in equine hospitals Extended spectrum beta lactamase producing Enterobacteriaceae considered as clinically and economically important to the AMR burden in human and veterinary medicine has been reported in both community and clinic equine populations Strains of Enterobacteriaceae pose a major worldwide threat due to the geographical expansion of ESBL producing clones as well as the horizontal interspecies dissemination of ESBL encoding plasmids and genes In human medicine ESBL E infection is associated with increased morbidity mortality length of hospital stay delay of targeted appropriate treatment and higher costs These issues also need to be addressed in horses This Special Issue on AMR in horses encompasses several papers that describe the prevalence risk factors and molecular data on MDR bacteria in healthy horses in Canada Japan Spain and Israel in addition to papers that

describe the clinical impact of MDR bacteria in diseased horses in Austria USA France and Israel **"One Health"**

Cloeckaert, Michel Stanislas Zygmunt, Benoît Doublet, 2018-01-26 Development and spread of antimicrobial resistance is the result of an evolutionary process by which microorganisms adapt to antibiotics through several mechanisms including alteration of drug target by mutation and horizontal transfer of resistance genes The concomitant occurrence of independent antimicrobial resistance mechanisms is a serious threat to human health and has appeared in several emerging epidemic

clones over the past decade in humans and also in animals The increasing prevalence of antimicrobial drug resistance among animal and zoonotic foodborne pathogens is of particular concern for public health In this Ebook we gathered a collection of articles which deal with the most important aspects of the genetics of acquired antimicrobial resistance extending from medically important resistance emerging epidemic resistant clones main mobile genetic elements spreading resistance resistomes dissemination between animals and humans to the One Health concept
