Thinking Functionally With Haskell:

Thinking Functionally with Haskell Richard Bird, 2014-10-09 Richard Bird is famed for the clarity and rigour of his writing. His new textbook which introduces functional programming to students emphasises fundamental techniques for reasoning mathematically about functional programs. By studying the underlying equational laws, the book enables students to apply calculational reasoning to their programs both to understand their properties and to make them more efficient. The book has been designed to fit a first or second year undergraduate course and is a thorough overhaul and replacement of his earlier textbooks. It features case studies in Sudoku and pretty printing and over 100 carefully selected exercises with solutions. This engaging text will be welcomed by students and teachers alike. [Thinking Functionally with Haskell](#) Richard Bird, 2015

This book introduces fundamental techniques for reasoning mathematically about functional programs. Ideal for a first or second year undergraduate course. [Algorithm Design with Haskell](#) Richard Bird, Jeremy Gibbons, 2020-07-09 This book is devoted to five main principles of algorithm design: divide and conquer, greedy algorithms, thinning, dynamic programming, and exhaustive search. These principles are presented using Haskell, a purely functional language, leading to simpler explanations and shorter programs than would be obtained with imperative languages. Carefully selected examples, both new and standard, reveal the commonalities and highlight the differences between algorithms. The algorithm developments use equational reasoning where applicable, clarifying the applicability conditions and correctness arguments. Every chapter concludes with exercises, nearly 300 in total, each with complete answers, allowing the reader to consolidate their understanding and apply the techniques to a range of problems. The book serves students both undergraduate and postgraduate, researchers, teachers, and professionals who want to know more about what goes into a good algorithm and how such algorithms can be expressed in purely functional terms. **Type-Driven Development with Idris** Edwin Brady, 2017-03-13

Summary: Type Driven Development with Idris, written by the creator of Idris, teaches you how to improve the performance and accuracy of your programs by taking advantage of a state-of-the-art type system. This book teaches you with Idris, a language designed to support type-driven development. Purchase of the print book includes a free eBook in PDF, Kindle, and ePub formats from Manning Publications.

About the Technology: Stop fighting type errors. Type-driven development is an approach to coding that embraces types as the foundation of your code, essentially as built in documentation. Your compiler can use to check data relationships and other assumptions. With this approach, you can define specifications early in development and write code that's easy to maintain, test, and extend. Idris is a Haskell-like language with first-class dependent types that's perfect for learning type-driven programming techniques you can apply in any codebase.

About the Book: Type Driven Development with Idris teaches you how to improve the performance and accuracy of your code by taking advantage of a state-of-the-art type system. In this book, you'll learn type-driven development of real-world software as well as how to handle side effects, interaction, state, and concurrency. By the end, you'll be able to develop robust

and verified software in Idris and apply type driven development methods to other languages

Mathematical Modelling by Help of Category Theory Dmitrii Legatiuk, 2025-03-19 This monograph

offers a novel structural perspective on the modelling of engineering problems utilizing abstract mathematics in the form of category theory. Specifically, the book aims to enhance the understanding of mathematical modelling by developing a category theory based framework. Category theory is employed to establish clear relationships between mathematical models and their complexities. The theory is then extended to encompass coupled mathematical models incorporating more advanced categorical structures. To bridge theory and practice, the book presents engineering applications of the abstract categorical framework, providing various modelling examples from real world engineering scenarios. Additionally, it introduces initial concepts for automatic model generation and error detection in modelling. The theory developed here demonstrates the practical utility of category theory, making this book a valuable resource for researchers in applied mathematics and engineering, particularly those focused on theoretical foundations of modelling.

Models, Algorithms, Logics and Tools

Luca Aceto, Giorgio Bacci, Giovanni Bacci, Anna Ingólfssdóttir, Axel Legay, Radu Mardare, 2017-08-17. This Festschrift is published in honor of Kim Guldstrand Larsen, one of the earliest precursors of computer science in Denmark on the occasion of his 60th birthday. During the last three decades, Kim Guldstrand Larsen has given major contributions across a remarkably wide range of topics, including real time concurrent and probabilistic models of computation, logic in computer science and model checking. Since 1995, he has been one of the prime movers behind the model checking tool for real time systems UPPAAL, for which he was a co-recipient of the CAV Award in 2013. The Festschrift contains 32 papers that feature the broad range of Kim Guldstrand Larsen's research topics, such as formal languages and automata theory, logic verification, model checking and testing, algorithmic game theory and mechanism design, semantics and reasoning, real time and distributed systems, and modeling and simulation.

Unifying Theories of Programming

Jonathan P. Bowen, Huibiao Zhu, 2017-01-10. This book constitutes the refereed proceedings of the 6th International Symposium on Unifying Theories of Programming (UTP 2016), held in Reykjavik, Iceland, in June 2016, in conjunction with the 12th International Conference on Integrated Formal Methods (iFM 2016). The 8 revised full papers presented were carefully reviewed and selected from 10 submissions. They deal with the fundamental problem of combination of formal notations and theories of programming that define, in various different ways, many common notions such as abstraction, refinement, choice, termination, feasibility, locality, concurrency, and communication. They also show that, despite many differences, such theories may be unified in a way that greatly facilitates their study and comparison.
