

Evidence of Evolution

Background

When Charles Darwin first proposed the idea that all life species descended from a common ancestor through natural selection, his proposal was met with skepticism. Today, the largest portion of evidence for the theory of evolution comes from the fields of paleontology, comparative anatomy, and molecular biology.

Focus

Students will compare evidence from leg bones of legless salamanders with evidence of the underlying bones.

				
				
Amphibian legless	Snake	Lizard	Frog	Bird

1. How does the evidence from the leg bones of the legless salamander and the lizard show that they are related?

The leg of the lizard is made of two bones, while the leg of the legless salamander is made of one bone.

2. What is the hypothesis that would explain the difference between the leg bones of the legless salamander and the lizard?

The hypothesis would be that the legless salamander and the lizard are related, but the legless salamander is a more primitive form.

3. What is the hypothesis that would explain the difference between the leg bones of the legless salamander and the bird?

The hypothesis would be that the legless salamander and the bird are related, but the legless salamander is a more primitive form. The legless salamander is a more primitive form than the bird, so it has a simpler leg structure.
