on deception and its detection Wolfgang Ambach,Matthias Gamer,2014-08-07 Deception is a ubiquitous phenomenon in social interactions and has attracted a significant amount of research during the last decades The majority of studies in this field focused on how deception modulates behavioral autonomic and brain responses and whether these changes can be used to validly identify lies Especially the latter question which historically gave rise to the development of psychophysiological lie detection techniques has been driving research on deception and its detection until today The detection of deception and concealed information in forensic examinations currently constitutes one of the most frequent applications of psychophysiological methods in the field With the increasing use of such methods the techniques for detecting deception have been controversially discussed in the scientific community It has been proposed to shift from the original idea of detecting deception per se to a more indirect approach that allows for determining whether a suspect has specific knowledge of crime related details This so called Concealed Information Test is strongly linked to basic psychological concepts concerning memory attention orienting and response monitoring Although research in this field has intensified with the advancement of neuroimaging techniques such as PET and fMRI in the last decade basic questions on the psychological

mechanisms underlying modulatory effects of deception and information concealment on behavioral autonomic and brain responses are still poorly understood This Research Topic brings together contributions from researchers in experimental psychology psychophysiology and neuroscience focusing on the understanding of the broad concept of deception including the detection of concealed information with respect to basic research questions as well as applied issues This Research Topic is mainly composed of original research articles but reviews and papers elaborating on novel methodological approaches have also been included Experimental methods include but are not limited to behavioral autonomic electroencephalographic or brain imaging techniques that allow for revealing relevant facets of deception on a multimodal level While this Research Topic primarily includes laboratory work relevant issues for the field use of such methods are also discussed **Reader's**

Diaspora William Harrison Taylor,Peter C. Messer,2016-01-28 Faith and Slavery in the Presbyterian Diaspora considers how in areas as diverse as the New Hebrides Scotland the United States and East Central Africa men's and women's shared Presbyterian faith conditioned their interpretations of and interactions with the institution of chattel slavery The chapters

highlight how Presbyterians reactions to slavery which ranged from abolitionism to indifference to support reflected their considered application of the principles of the Reformed Tradition to the institution Consequently this collection reveals how the particular ways in which Presbyterians framed the Reformed Tradition made slavery an especially problematic and fraught issue for adherents to the faith Faith and Slavery by situating slavery at the nexus of Presbyterian theology and practice offers a fresh perspective on the relationship between religion and slavery It reverses the all too common assumption that religion primarily served to buttress existing views on slavery by illustrating how groups and individuals reactions to slavery emerged from their understanding of the Presbyterian faith The collection s geographic reach encompassing the experiences of people from Europe Africa America and the Pacific filtered through the lens of Presbyterianism also highlights the global dimensions of slavery and the debates surrounding it The institution and the challenges it presented Faith and Slavery stresses reflected less the peculiar conditions of a particular place and time than the broader human condition as people attempt to understand and shape their world
