A Different Thermodynamics and its True Heroes Evgeni B. Starikov, 2019-04-01 Modern thermodynamics is a unique but still not a logically self consistent field of knowledge It has a proven universal applicability and significance but its actual potential is still latent The development of the foundations of thermodynamics was in effect non stop but absolutely no one has any idea about this This book is the first of its kind that will motivate researchers to build up a logically consistent field of thermodynamics It greatly appreciates the actual depth and potential of thermodynamics which might also be of interest to readers in history and philosophy of scientific research The book presents the life stories of the protagonists in detail and allows readers to cast a look at the whole scene of the field by showcasing a significant number of their colleagues whose works have fittingly complemented their achievements It also tries to trigger a detailed analysis of the reasons why the actual work in this extremely important field has in effect gone astray It comprises five chapters and introduces three scientists in the first two chapters which are specifically devoted to the Scandinavian achievements in macroscopic thermodynamics These introductions are novel and call for a detailed reconsideration of the field The third chapter acquaints the readers with their fourth colleague in Germany who was working on the proper link between the macroscopic thermodynamics kinetics and the atomistic representation of matter The fourth chapter brings in their fifth colleague in the United States who could formally infer the famous formula $S = k \ln W$ ingeniously guessed by Ludwig Boltzmann and thus clarify the physical sense of the entropy notion The last chapter summarizes the above mentioned discourses

Conceptual

Profiles Eduardo F. Mortimer, Charbel N. El-Hani, 2014-02-07 The language of science has many words and phrases whose meaning either changes in differing contexts or alters to reflect developments in a given discipline This book presents the authors theories on using conceptual profiles to make the teaching of context dependent meanings more effective Developed over two decades their theory begins with a recognition of the coexistence in the students discourse of those alternative meanings even in the case of scientific concepts such as molecule where the dissonance between the classical and modern views of the same phenomenon is an accepted norm What began as an alternative model of conceptual change has evolved to incorporate a sociocultural approach by drawing on ideas such as situated cognition and Vygotsky s influential concept of culturally located learning Also informed by pragmatist philosophy the approach has grown into a well rounded theory of teaching and learning scientific concepts The authors have taken the opportunity in this book to develop their ideas further anticipate and respond to criticisms that of relativism for example and explain how their theory can be applied to analyze the teaching of core concepts in science such as heat and temperature life and biological adaptation They also report on the implementation of a research program that correlates the responsiveness of their methodology to all the main developments in the field of science education This additional material will inform academic discussion review and further enhancement of their theory and research model
