Computer Methods Part B, 2009-11-05. The combination of faster, more advanced computers and more quantitatively oriented biomedical researchers has recently yielded new and more precise methods for the analysis of biomedical data. These better analyses have enhanced the conclusions that can be drawn from biomedical data and they have changed the way that experiments are designed and performed. This volume, along with previous and forthcoming Computer Methods volumes for the Methods in Enzymology series, aims to inform biomedical researchers about recent applications of modern data analysis and simulation methods as applied to biomedical research. It presents step-by-step computer methods and discusses the techniques in detail to enable their implementation in solving a wide range of problems. It informs biomedical researchers of the modern data analysis methods that have developed alongside computer hardware. It presents methods at the nuts and bolts level to identify and resolve a problem and analyze what the results mean.

Materials Kinetics John C. Mauro, 2020-11-22. Materials Kinetics: Transport and Rate Phenomena provides readers with a clear understanding of how physical chemical principles are applied to fundamental kinetic processes. The book integrates advanced concepts with foundational knowledge and cutting-edge computational approaches, demonstrating how diffusion, morphological evolution, viscosity, relaxation, and other kinetic phenomena can be applied to practical materials design problems across all classes of materials. The book starts with an overview of thermodynamics, discussing equilibrium, entropy, and irreversible processes. Subsequent chapters focus on analytical and numerical solutions of the diffusion equation, covering Fick's laws, multicomponent diffusion, numerical solutions, atomic models, and diffusion in crystals, polymers, glasses, and polycrystalline materials. Dislocation and interfacial motion, kinetics of phase separation, viscosity, and advanced nucleation theories are examined next, followed by detailed analyses of glass transition and relaxation behavior. The book concludes with a series of chapters covering molecular dynamics, energy landscapes, broken ergodicity, chemical reaction kinetics, thermal and electrical conductivities, Monte Carlo simulation techniques, and master equations. It covers the full breadth of materials kinetics, including organic and inorganic materials, solids and liquids, theory and experiments, macroscopic and microscopic interpretations, and analytical and computational approaches. It demonstrates how diffusion, viscosity, microstructural evolution, relaxation, and other kinetic phenomena can be leveraged in the practical design of new materials. It provides a seamless connection between thermodynamics and kinetics. It includes practical exercises that reinforce key concepts at the end of each chapter.
