Vitamin C or ascorbic acid is mainly present in fruits and vegetables The consumption of such foods is important since the human body does not have the ability to produce this essential micronutrient Because it is water soluble it can also easily be lost in cooking and long term storage Even though the role of vitamin C has been known since the early 1930s only recently have researchers been actively studying and demonstrating its role and function in the treatment and prevention of many diseases These studies will be the key to providing the scientific basis that explains why this simple but important vitamin possesses such a wide range of positive biological activities **Degradation of Ascorbic Acid in Different**

Ascorbic acid is a small simple water soluble molecule synthesised by most plants and animals with the exception of humans and some animal species due to mutations in the gene encoding the terminal enzyme in the biosynthetic pathway. For humans it is thus a vitamin: vitamin C that must be obtained from the diet with complete deficiency resulting in the fatal disease scurvy. Many functions have been attributed to this fascinating molecule and despite nearly 90 years of research since its discovery new roles are still being uncovered including recent discoveries that it acts as a regulator of epigenetic marks and transcription factors ¹. In this volume we begin with a review by Michels and Frei on specific factors that need to be taken into consideration when carrying out vitamin C research. Translational research normally comprises a progression from in vitro cell culture studies to animal models and finally to clinical trials. At each of these stages there are requirements specific to vitamin C research that need to be integrated into study designs and this review describes these in detail.
