

Solution Manual for Real Time System by Jane W. S. Liu

Real Time System by Jane W. S. Liu (Pearson), the book builds on the student's background in Operating Systems, Embedded Systems. It covers techniques for scheduling, resource access control, and validation that are, or are likely to be, widely used in real time computing and communication systems. Each algorithm, protocol, or mechanism is defined by pseudo code or simple rules that can serve as a starting point of implementation. With few exceptions, each scheduling algorithm is accompanied that your application will meet its real time requirement when scheduling according to the algorithm.

Here, in next successive posts, I am going to post solutions for the same Text-book (Real Time System by Jane W. S. Liu). If you find any difficulty or wants to suggest anything, feel free to comment.....!

Real Time System by Jane W. S. Liu Chapter 3.1 Solution

Q. 3.1: Because sporadic jobs may have varying release times and execution times, the periodic task model may be too inaccurate and can lead to undue under utilization of the processor even when the inter release times of jobs are bounded from below and their executions are bounded from above. As an example, suppose we have a stream of sporadic jobs whose inter release times are uniformly distributed from 0 to 11. Their execution times are uniformly distributed from 1 to 3.

a. What are the parameters of the periodic task if we were to use such a task to model the stream?

Verification and Exploration of Task-Level Concurrency in Real-Time Embedded Systems Filip Thoen, Francky Catthoor, 2012-12-06 system is a complex object containing a significant percentage of electronics that interacts with the Real World physical environments humans etc through sensing and actuating devices A system is heterogeneous i.e. is characterized by the co existence of a large number of components of disparate type and function for example programmable components such as micro processors and Digital Signal Processors DSPs analog components such as A/D and D/A converters sensors transmitters and receivers Any approach to system design today must include software concerns to be viable In fact it is now common knowledge that more than 70% of the development cost for complex systems such as automotive electronics and communication systems are due to software development In addition this percentage is increasing constantly It has been my take for years that the so called hardware software co design problem is formulated at a too low level to yield significant results in shortening design time to the point needed for next generation electronic devices and systems The level of abstraction has to be raised to the Architecture Function co design problem where Function refers to the operations that the system is supposed to carry out and Architecture is the set of supporting components for that functionality The supporting components as we said above are heterogeneous and contain almost always programmable components **Distributed, Parallel and Biologically Inspired Systems** Mike Hinchey, Bernd Kleinjohann, Lisa
