neurodevelopment among other health effects Although drinking water quality is regulated and monitored in many countries increasing knowledge leads to the need for reviewing standards and guidelines on a nearly permanent basis both for regulated and newly identified contaminants Drinking water standards are mostly based on animal toxicity data and more robust epidemiologic studies with accurate exposure assessment are needed The current risk assessment paradigm dealing mostly with one by one chemicals dismisses the potential synergisms or interactions from exposures to mixtures of contaminants particularly at the low exposure range Thus evidence is needed on exposure and health effects of mixtures of contaminants in drinking water Finally water stress and water quality problems are expected to increase in the coming years due to climate change and increasing water demand by population growth and new evidence is needed to design appropriate adaptation policies This Special Issue of International Journal of Environmental Research and Public Health IJERPH focuses on the current state of knowledge on the links between drinking water quality and human health **The Palgrave**
