Geological Sequestration of Carbon Dioxide Luigi Marini, 2006-10-12 The contents of this monograph are two scope First it intends to provide a synthetic but complete account of the thermodynamic and kinetic foundations on which the reaction path modeling of geological CO₂ sequestration is based In particular a great effort is devoted to review the thermodynamic properties of CO₂ and of the CO₂ H₂O system and the interactions in the aqueous solution the thermodynamic stability of solid product phases by means of several stability plots and activity plots the volumes of carbonation reactions and especially the kinetics of dissolution precipitation reactions of silicates oxides hydroxides and carbonates Second it intends to show the reader how reaction path modeling of geological CO₂ sequestration is carried out To this purpose the well known high quality EQ3 6 software package is used Setting up of computer simulations and obtained results are described in detail and used EQ3 6 input files are given to guide the reader step by step from the beginning to the end of these exercises Finally some examples of reaction path and reaction transport modeling taken from the available literature are presented The results of these simulations are of fundamental importance to evaluate the amounts of potentially sequestered CO₂ and their evolution with time as well as the time changes of all the other relevant geochemical parameters e g amounts of solid reactants and products composition of the aqueous phase pH redox potential effects on aquifer porosity In other words in this way we are able to predict what occurs when CO₂ is injected into a deep aquifer Provides applications for investigating and predicting geological carbon dioxide sequestration Reviews the geochemical literature in the field Discusses the importance of

The Thermodynamics of Linear Fluids and Fluid Mixtures Miloslav Pekař, Ivan Samohýl, 2013-11-19 In this book Samohýl and Pekař offer a consistent and general non equilibrium thermodynamic description for a model of chemically reacting mixtures This type of model is frequently encountered in practice and up until now chemically reacting systems out of equilibrium have rarely been described in books on non equilibrium thermodynamics Readers of this book benefit from the systematic development of the theory this starts with general principles going through the applications to single component fluid systems and finishing with the theory of mixtures including chemical reactions The authors describe the simplest mixture model the linear fluid and highlight many practical and thermodynamically consistent equations for describing transport properties and reaction kinetics for this model Further on in the book the authors also describe more complex models Samohýl and Pekař take special care to clearly explain all methodology and starting axioms and they also describe in detail applied assumptions and simplifications This book is suitable for graduate students in chemistry materials science and chemical engineering as well as professionals working in these and related areas
