DNA Replication

1. Circle the word or phrase that correctly completes each sentence.

- The DNA contained in each of the cells that make up a multicellular organism, such as a giraffe, is all [**identical to**/different from] the DNA in the very first cell.
- DNA replication [**reduces/conserves**] genetic information as organisms grow and reproduce.

Structure and Function of DNA

2. Fill in the blanks to complete the sentences.

- Duplex DNA is twisted into a **double helix** and held together by **hydrogen** bonds.
- Each strand of DNA can be used as a template for a new strand because the nucleotide bases form complementary pairs: **adenine** always pairs with thymine, and **guanine** always pairs with cytosine.
- The two strands of a DNA molecule are **antiparallel**, so that the 3' end of one strand always meets with the 5' end of the other.
- During DNA replication, new nucleotides can be added only to the 3' end of a growing strand, so DNA strands always grow in the 5' to 3' direction.
