

Tips for naming molecules

There are three steps, though that I have found useful over the years. The first concerns organic molecules in their simplest form, those for primary school pupils.

Remember that the name of an organic molecule has three parts:

- **Numbering** (if necessary)
- **Base**: the parent chain (length and C/C bonding)
 - o Also called the stem and often simply 'stem'.
- **Suffix**: substituents attached by the highest priority functional group.

1. Start off by identifying the highest priority functional group: this helps you determine the suffix of the molecule's name and can help you determine where to start numbering the parent chain. In subsequent paragraphs I discuss how you begin to identify the parts of the molecule that will be added to the prefix.

If you only have C and H atoms left you have hydrocarbons that are based on parent hydrocarbons: the prefix is the key.

2. There begins to be the longest continuous carbon chain you can (the only 'path' to look for is up).

- Make sure that your parent chain contains the highest priority functional group. Some groups have to be on the end carbon.
 - o Carboxylic acids, aldehydes, nitriles, amines, amides
- Find the other side of the chain that most carbon chains are the longest the next to same length (if sharing).
- Always contain all the functional groups and multiple bonds in the structure.

3. Begin to number the carbon, the lowest number that you can so that the end of the chain is the parent chain number by the following substituents (if other not groups):

- The highest priority functional group
- Any multiple bonds.
- The substituent closest to the end
- The longest the carbon chain is possible.

4. Once you have numbered the parent chain, you can now the appropriate name to indicate the length of the chain.

5. Identify the other substituents (other groups) on the parent chain and add them to the name. Additionally, identify what carbon they are (the chain is the base number).

- Only C/C single bonds 'are'
