

1713 Unsymmetrical Bending Apparatus

Apparatus consists of a mild steel angle of size $1" \times 1" \times 1/8"$ or an equivalent metric units of length 80cm is tied as a cantilever beam. The beam should be fixed at one end such that the rotation of 45° intervals are given and clamped such that the principal axis of its cross-section may be inclined at any angle with the horizontal and vertical planes. Also arrangement will be provided to apply vertical load at the free end of the cantilever and to measure horizontal and vertical deflection of the free end. A dial gauge with 25mm travel (with magnetic base) will be supplied with the apparatus. Apparatus will be supplied complete with a supporting stand and a set of weights.

1714 Pinned Joint Model

Model consists of hinged joints. Model will be able to demonstrate the qualitative behavior of the truss under load. As the members are very flexible, a compression member will easily show its buckling i.e. it will curve out of plane. The tension member however remains straight and tight. The student will therefore have a visual picture of the type of stresses i.e. compressive or tensile that each member of truss will carry under various positions of the load. In case of pinned joint truss, the student will be able to observe that angle between members at each joint undergo a small change.
