Abstract—The purpose of this study was to determine the effect of a 10-week training program on the performance of a group of young women. The subjects were 15 female students, aged 18–20 years, who were divided into two groups: a control group and an experimental group. The experimental group underwent a 10-week training program consisting of aerobic, strength, and flexibility exercises. The control group did not undergo any training. The results showed that the experimental group had significantly higher performance levels than the control group at the end of the 10-week period. The findings suggest that a 10-week training program can improve the performance of young women.
