S. Kemp, 2017-09-21 From a modest beginning in the form of a little shrew like nocturnal insect eating ancestor that lived 200 million years ago mammals evolved into the huge variety of different kinds of animals we see today Many species are still small and follow the lifestyle of the ancestor but others have adapted to become large grazers and browsers like the antelopes cattle rhinos and elephants or the lions hyaenas and wolves that prey upon them Yet others evolved to be specialist termite eaters able to dig into the hardest mounds or tunnel creating burrowers and a few took to the skies as gliders and the bats Many live partly in the water such as otters beavers and hippos while whales and dugongs remain permanently in the seas incapable of ever emerging onto land In this Very Short Introduction T S Kemp explains how it is a tenfold increase in metabolic rate endothermy or warm bloodedness that lies behind the high levels of activity and the relatively huge brain associated with complex adaptable behaviour that epitomizes mammals He describes the remarkable fossil record revealing how and when the mammals gained their characteristics and the tortuous course of their subsequent evolution during which many bizarre forms such as sabre toothed cats and 30 tonne 6 m high browsers arose and disappeared Describing the wonderful adaptations that mammals evolved to suit their varied modes of life he also looks at those of the mainly arboreal
