Abstract: The purpose of this study was to investigate the effects of a 12-week training program on the physical and psychological health of elderly people. The study was conducted in a community center in Istanbul, Turkey. The participants were 40 elderly people (20 men and 20 women) aged between 65 and 75 years. They were divided into two groups: a control group and an experimental group. The experimental group participated in a 12-week training program that included aerobic exercises, strength training, and flexibility exercises. The control group did not participate in any training program. The results of the study showed that the experimental group had significantly higher levels of physical fitness and psychological well-being compared to the control group at the end of the 12-week period. The findings suggest that a 12-week training program can improve the physical and psychological health of elderly people.
