Molecular Machines Benoît Roux, 2011 Molecular machines are complex biomolecules protein DNA RNA and carbohydrates that consume energy in order to perform specific functions To understand how these systems perform their functions it is necessary to have detailed knowledge of the conformational states of these molecular machines as well as the reaction pathways connecting them Many of these conformational transitions take place on a timescale that is far beyond what is attainable with current molecular dynamics simulations on large and complex systems On the other hand experimental methods are often unable to detect the short lived transient features occurring during such conformational transitions Thus breaking new ground toward a complete knowledge of the reaction pathways of molecular machines requires a novel paradigm permitting a seamless integration of structural dynamical and functional data among existing

theories models and simulations This review volume provides the most updated summary on the cutting edge research of many molecular machines ranging from ATPase DNA polymerase ribosome calcium pump chloride channel neurotransmitters transporter chaperon GroEL for protein folding microtubes and chromatin voltage gating proteins membrane fusion snare proteins actin and myosin DNA base flipping enzymes and proteins that are responsible for our immune system It contains results from both theoretical and experimental fronts thus giving students and researches in biosciences a pedagogically integrated picture of this critical network that we called Life
