Written as an introductory text for advanced undergraduates and first year graduate students, the new edition provides the background necessary for solving complex problems in fluid mechanics and heat transfer.

Computational Fluid Mechanics and Heat Transfer, Third Edition Richard H. Pletcher, John C. Tannehill, Dale Anderson, 2012-08-30 Thoroughly updated to include the latest developments in the field, this classic text on finite difference and finite volume computational methods maintains the fundamental concepts covered in the first edition. As an introductory text for advanced undergraduates and first year graduate students, Computational Fluid Mechanics and Heat Transfer Third Edition provides the background necessary for solving complex problems in fluid mechanics and heat transfer. Divided into two parts, the book first lays the groundwork for the essential concepts preceding the fluids equations in the second part. It includes expanded coverage of turbulence and large eddy simulation (LES) and additional material included on detached eddy simulation (DES) and direct numerical simulation (DNS). Designed as a valuable resource for practitioners and students, new homework problems have been added to further enhance the student's understanding of the fundamentals and applications.

Viscous Fluid Flow Frank M. White, 1991 Designed for higher level courses in viscous fluid flow, this text presents a comprehensive treatment of the subject. This revision retains the approach and organization for which the first edition has been highly regarded while bringing the material completely up to date. It contains new information on the latest technological advances and includes many more applications, thoroughly updated problems, and exercises.

Two-dimensional Navier-Stokes Solution of the Flow Over a Thick Supercritical Airfoil with Strong Shock-induced Separation Don W. Kinsey, 1988 This report describes a numerical solution of the Navier-Stokes equations for transonic flow over a thick supercritical airfoil with strong shock-induced separation on both the upper and lower surfaces. The separated flow region extends from the shock approximately 50% chord to the trailing edge on both surfaces. The report first reviews the processes involved in producing a computational solution of the Navier-Stokes equations for a

two dimensional airfoil in a perfect gas A brief development of the Navier Stokes equations is provided The solution algorithm used an explicit predictor corrector method is developed and described An algebraic turbulence model used to model the turbulent Reynolds stresses is described and the need for such a model is discussed A hyperbolic two dimensional procedure for producing a computational grid mesh is also described The boundary conditions imposed at the outer regions of the computational domain farfield and at the airfoil surface are discussed and described The second part of the report discusses the treatment of the eddy viscosity development through the shock in the separated regions over the airfoil and in the near wake This work was critical for obtaining a successful solution on the very difficult test case chosen Modifications to an algebraic eddy viscosity model to include the effects of the thickness of the separated flow region downstream of the shock are described
