Scenario

Consider a ball of mass M connected to a string of length L . A student holding the free end of the string whirls the ball in a horizontal circle with constant speed. The angle between the string and the vertical is θ . The student attempts to whirl the ball faster and faster in order to make the string become horizontal. No matter how fast the student whirls the ball, the string is never exactly horizontal.

**Using Representations**

- PART A:
- The dot below represents the ball at the instant it appears in the diagram. Draw a free-body diagram showing and labeling the forces (not components) exerted on the ball. Draw the relative lengths of all vectors to reflect the relative magnitudes of all the forces.
 - By discussing specific features of your force diagram, explain why the rope cannot become completely horizontal no matter how fast the ball is whirled.

Because the gravitational force is always pointing down, there must always be some vertical component of the tension to keep the ball in vertical equilibrium. Whirling the ball faster increases the horizontal component of the tension, but with any vertical component, F_T is never horizontal.

**Create an Equation**

- PART B:
- Derive an equation that relates the speed v of the ball in its circle to the string length L and angle θ . [Hint: What force component provides the centripetal acceleration? How can you find the radius of the circle in terms of L and θ ?]

$\Sigma F_y = ma_y$	The sum of the forces in the vertical direction is equal to ma_y .
$F_T \cos \theta - mg = ma_y$	In the vertical direction, there is one component of the force of tension upward and the gravitational force downward. (We know to take the components of the Tension force here because the acceleration of the ball is directly in toward the center; therefore, parallel and perpendicular to that direction are our axes.)
