

OPERATION OF BASIC GOVERNOR

GENERAL: The principal parts of the governor are a gear-type oil pump with pressure relief valve, flyweights pivoted on a rotating flyweight head, a spring-loaded pilot valve positioned by the flyweights, and an external control lever that varies the spring load on the pilot valve. The body, cover, and base are made of aluminum. The body contains the necessary passage to channel oil to the propeller pitch changing mechanism, and the base is designed to fit the standard AND20010 engine pad.

Two safety features are incorporated in the governor design. The first is the control lever spring. This is attached to the speed adjusting control lever and, in the event of control linkage failure, holds the lever in the position at which the failure occurred or tends to move it toward the high rpm position. This allows the engine to operate at or near full rated speed and to develop maximum power. The second safety feature is the positive high pitch or feathered setting for models with a lift rod. Moving the speed adjusting

control lever against the low speed stop raises the pilot valve to a positive high pitch or feathering position regardless of flyweight force. This allows the pilot to minimize propeller drag in the event of engine failure by moving the propeller blades to the high pitch position or, if a feathering-type propeller, to the feathered position.

The sensing element of the governor is a set of pivoted flyweights mounted on a rotating flyweight head and linked mechanically to the engine gears, through a hollow drive gear shaft. The flyweights, actuated by the centrifugal force developed by the speed of their rotation, position a pilot valve so as to cover or uncover ports in the drive gear shaft and regulate the flow of oil to and from the pitch changing mechanism of the propeller. The centrifugal force exerted by the flyweights is opposed by the force of an adjustable speeder spring. The load exerted by the speeder spring determines the engine rpm required to develop sufficient centrifugal force in the flyweights to center the pilot valve. Oil to operate the propeller's pitch changing mechanism is supplied by a gear-type oil pump at a pressure value limited by a relief valve.
