

Work Energy Theorem

Objective

The objective of this experiment is to examine the conversion of work into kinetic energy, specifically work done by the force of gravity. The work-kinetic energy theorem equates the net force (gravity, friction, air resistance, etc.) acting on a particle with the kinetic energy gained or lost by that particle.

If there are no other external forces acting on the system and doing work, the sum of these two forms of energy is conserved.

Theory

If an amount of work, W , is done on a system, then the kinetic energy, KE , of the system changes. The change in the kinetic energy is equal to the amount of work done. Stated quantitatively:

Where, v_f and v_i are the final and initial velocities of the object.

Equation 3, is a statement of the work-energy theorem and is the foundation of much of our science. As such, questions of its validity are certainly worth your consideration. The Work-Energy Theorem presents a way of dealing with kinematic quantities in mechanics without regard for vector direction. These directionless quantities, such as kinetic energy, are called scalars.

In this lab, we will test the work energy theorem using an object sliding the ramp (Figure 1). When there is no friction, the object will slide due to the gravitational force component acting along the surface (). Knowing the distance d traveled along the surface, we can calculate the work:

(4)

The object will accelerate due to the acceleration vector component along the surface, which can be calculated using

(5)

Thus, the object will accelerate from the rest and have a velocity

(6)

Therefore, if we know the time it takes the object to reach the bottom of the ramp,

we can calculate the final velocity.
