Sousa,2015-12-07 The pathogenic mechanisms underlying primary T cell disorders are mainly related to molecular alterations of genes whose expression is intrinsic to hematopoietic cells However since the differentiation process requires a crosstalk among thymocytes and the thymic microenvironment molecular alterations of genes involved in the differentiation and functionality of the stromal component of the thymus may lead to a severe T cell defect or failure of central tolerance as well The first example of severe combined immunodeficiency SCID not related to an intrinsic alteration of the hematopoietic cell but rather of the thymic epithelial component is the Nude SCID phenotype inherited as an autosomal recessive disorder whose hallmarks are the T cell defect and the absence of the thymus The clinical and immunological phenotype is the human equivalent of the murine Nude SCID syndrome which represents the first spontaneous SCID identified in nude mice in 1966 For over 3 decades studies of immune system in these mice enormously contributed to the overall knowledge of cell mediated immunity in the assumption that the athymia of these mice was solely responsible for the T cell immunological defect This syndrome is due to mutations of the transcription factor FOXP1 belonging to the forkhead box gene family which is mainly expressed in the thymus and skin epithelial cells where it plays a critical role in differentiation and survival An alteration of the thymic structure is also a feature of the DiGeorge syndrome DGS which has been long considered the human counterpart of the nude mice phenotype This syndrome is frequently associated to a deletion of the 22q11 region which contains approximately 30 genes including the TBX1 gene which is responsible for most of the clinical features of DGS in humans and mice In this syndrome common manifestations are cardiac malformations speech delay hypoparathyroidism and immunodeficiency even though the immunological hallmarks of the T cell defect in DiGeorge syndrome are profoundly different from those reported in human Nude SCID The divergence of the phenotype among these 2 entities raised the possibility that the FOXP1 transcription factor represents the real key stromal molecule implicated in directing the hematopoietic stem cell toward a proper T cell fate Thymic stromal component of the primary lymphoid organ is also required to negatively select the autoreactive clones a process driven by the expression of tissue specific antigens TSA by medullary thymic epithelial cells mTECs The expression

of genes encoding TSA antigens is mediated by autoimmune regulator AIRE gene encoding a transcription factor expressed in mTECs Molecular alterations of this gene are associated to autoimmune polyendocrinopathy candidiasis ectodermal dystrophy APECED a rare autosomal disorder which may be considered the prototype of an autoimmune disease due to the failure of central tolerance homeostasis All these experiments of nature led to unravel novel pathogenic mechanisms underlying inherited disorders of immune system and of note to clarify the pivotal role of epithelial cells in the maturation and education process of T cell precursors

Philosophical Problems of Modern Biology Jan Kamarýt,1965 Genetic Medicine Barton Childs,2003-09-15 In Genetic Medicine A Logic of Disease Barton Childs demonstrates that knowledge of the ways both genes and environment contribute to disease provides a rational basis for medical thinking This genetic medicine he explains should help the physician use the results of laboratory tests to perceive the uniqueness of the patient as well as that of the family and the cultural conditions in which the patient s condition arose Childs thus provides a conceptual framework within which to teach and practice a humane medicine

Handbook of Neurobehavioral Genetics and Phenotyping Valter Tucci,2017-03-06 The Handbook of Behavioral Genetics and Phenotyping represents an integrative approach to neurobehavioural genetics worldwide experts in their field will review all chapters Advanced overviews of neurobehavioural characteristics will add immense value to the investigation of animal mutants and provide unique information about the genetics and behavioural understanding of animal models under both normal and pathological conditions Cross species comparisons of neurobehavioural phenotypes will pave the way for an evolutionary understanding of behaviour Moreover while biological sciences are progressing towards a holistic approach to investigate the complexity of organisms i e systems biology approach an integrated analysis of behavioural phenotyping is still lacking The Handbook of Behavioral Genetics and Phenotyping strengthens the cross talk within disciplines that investigate the fundamental basis of behaviour and genetics This will be the first volume in which traditionally distant fields including genomics behaviour electrophysiology neuroeconomics and computational neuroscience among others are evaluated together and simultaneously accounted for during discussions of future perspectives
