reducing costs However applying them involves the challenge of handling stochastic network delays which can degrade control performance To address this problem commonly used simple PID could be employed However PID suffers from gain range limitations when used in a delayed environment Furthermore model based controllers are complex and require exact models of the process and systematic system identification for implementation Therefore to address these issues the book proposes control strategies that retain the simplicity of PID in terms of ease of tuning and structure while improving on the performance of the closed loop system with regard to stochastic network delays and mismatches Concretely it proposes and discusses three strategies namely Setpoint Weighting SW Filtered Predictive PI FPPI and Optimal Fuzzy PID In order to optimise some of these controllers two novel hybrid optimisation algorithms combining the dynamism of the Bacterial Foraging Algorithm BFA and advantages of both the Spiral Dynamic Algorithm SDA and the Accelerated Particle Swarm Optimisation APSO have been used The strategies proposed here can also be applied in stochastic control scenarios not necessarily wireless characterised by uncertainties This book will be useful to engineers and researchers in both industry and academia In industry it will be particularly useful to research and development efforts where PID controllers and wireless sensor networks WSNs involving both short and long term stochastic network delay are employed Thus it can be used for real time control design in these areas In the academic setting the book will be useful for researchers undergraduate and graduate students of instrumentation and control It can also be used as reference material for teaching courses on predictive and adaptive controls and their application
