Thinking with Mathematical Models, 2002 **Recurrence Relations** Mick Bromilow, 1982 **Mathematical Modeling of Social Relationships** Urszula Strawinska-Zanko, Larry S. Liebovitch, 2018-06-07 This edited volume presents examples of social science research projects that employ new methods of quantitative analysis and mathematical modeling of social processes This book presents the fascinating areas of empirical and theoretical investigations that use formal mathematics in a way that is accessible for individuals lacking extensive expertise but still desiring to expand their scope of research methodology and add to their data analysis toolbox Mathematical Modeling of Social Relationships professes how mathematical modeling can help us understand the fundamental compelling and yet sometimes complicated concepts that arise in the social sciences This volume will appeal to upper level students and researchers in a broad area of fields within the social sciences as well as the disciplines of social psychology complex systems and applied mathematics

Mathematical Models and Their Analysis Frederick Y. M. Wan, 2018-03-20 A great deal can be learned through modeling and mathematical analysis about real life phenomena even before numerical simulations are used to accurately portray the specific configuration of a situation Scientific computing also becomes more effective and efficient if it is preceded by some preliminary analysis These important advantages of mathematical modeling are demonstrated by models of historical importance in an easily understandable way The organization of Mathematical Models and Their Analysis groups models by the issues that need to be addressed about the phenomena The new approach shows how mathematics effective for one modeled phenomenon can be used to analyze another unrelated problem For instance the mathematics of differential equations useful in understanding the classical physics of planetary models fluid motion and heat conduction is also applicable to the seemingly unrelated phenomena of traffic flow and congestion offshore sovereignty and regulation of overfishing and deforestation The formulation and in depth analysis of these and other models on modern social issues such as the management of exhaustible and renewable resources in response to consumption demands and economic growth are of increasing concern to students and researchers of our time The modeling of current social issues typically starts with a simple but meaningful model that may not capture all the important elements of the phenomenon Predictions extracted from such a model may be informative but not compatible with all known observations so the model may require improvements The cycle of model formulation analysis interpretation and assessment is made explicit for the modeler to repeat until a model is validated by consistency with all known facts **Mathematical Models in the Social and Behavioral Sciences**

Anatol Rapoport, 1983 **Mathematical Models And Methods Of Localized Interaction Theory** Abram I Bunimovich, Anatolii V Dubinskii, 1995-02-14 The interaction of the environment with a moving body is called localized if it has been found or assumed that the force or and thermal influence of the environment on each body surface point is independent and can be determined by the local geometrical and kinematical characteristics of this point as well as by the

parameters of the environment and body environment interactions which are the same for the whole surface of contact Such models are widespread in aerodynamics and gas dynamics covering supersonic and hypersonic flows and rarefied gas flows They describe the influence of light on a body and are used for modelling penetration of solids into metals and soils etc

Localized Interaction Theory LIT studies various theoretical and applied problems using the most general description of the influence of the environment on the body This makes it possible to integrate results obtained from different models and to create new universal methods that can be used for various conditions even if the description of the real interaction model is unknown Such a unified approach to the problems of analysis calculation and optimization of the integral characteristics of bodies moving in different media is the main content of this book which is the first monograph on this subject Many applications chiefly in aerodynamics and space engineering are presented

Mathematical Models and Applications Daniel P. Maki, Maynard Thompson, 1973 This book began as lecture notes developed in connection with a course of the same name given since 1968 at Indiana University The audience can be loosely grouped as follows junior and senior mathematics majors many of whom contemplate graduate work in other fields undergraduate and graduate students majoring in the social and life sciences and in business and prospective secondary teachers of mathematics In addition portions of the material have been used in NSF institutes for mathematics teachers The goal of the course has been to provide the student with an appreciation for an understanding of and a facility in the use of mathematics in other fields The role of mathematical models in explaining and predicting phenomena arising in the real world is the central theme Preface

Modeling Love Dynamics Sergio E. T. Al RINALDI, 2015-10-22 This book shows for the very first time how love stories a vital issue in our lives can be tentatively described with classical mathematics Focus is on the derivation and analysis of reliable models that allow one to formally describe the expected evolution of love affairs from the initial state of indifference to the final romantic regime The models are in full agreement with the basic philosophical principles of love psychology Eight chapters are theoretically oriented and discuss the romantic relationships between important classes of individuals identified by particular psychological traits The remaining chapters are devoted to case studies described in classical poems or in worldwide famous films

Linear Models in the Mathematics of Uncertainty Carol Jones, Mark J Wierman, Terry D Clark, Alex Pham, Michael A. Redmond, 2013-02-01 The purpose of this book is to present new mathematical techniques for modeling global issues These mathematical techniques are used to determine linear equations between a dependent variable and one or more independent variables in cases where standard techniques such as linear regression are not suitable In this book we examine cases where the number of data points is small effects of nuclear warfare where the experiment is not repeatable the breakup of the former Soviet Union and where the data is derived from expert opinion how conservative is a political party In all these cases the data is difficult to measure and an assumption of randomness and or

statistical validity is questionable We apply our methods to real world issues in international relations such as nuclear deterrence smart power and cooperative threat reduction We next apply our methods to issues in comparative politics such as successful democratization quality of life economic freedom political stability and failed states Finally issues involving deaf and hard of hearing children are explored *Mathematical Models* Arnold Emch,1921 **Mathematical Models in the**
