ABSTRACT

The aorta plays a major role in the cardiovascular system and its function and structure are primarily affected by aging, eating habits, life style and other cardiovascular risk factors, inducing increased stiffness which is associated with cardiovascular and cerebral morbi-mortality. Our objective was to develop and validate a robust subject-specific one-dimensional wave propagation numerical model of the descending aorta. This model with a cross-sectional area, velocity and pressure formulation is built using geometric and hemodynamic data measured on a specific person and is validated against *in vivo* data acquired on the same subject at three distinct anatomical locations along the thoracic aorta. We studied seven healthy volunteers, who underwent carotid applanation tonometry and aortic cardiovascular magnetic resonance (CMR). Responses of our model in terms of changes in central pressure waveform with arterial alterations were consistent with previously described physiological knowledge. Quantitative validation averaged over the three descending aortic locations and the seven subjects provided low rms errors (given in percentage of the maximal clinical value) between simulated and CMR data, i.e. area: $10 \pm 6\%$, velocity: $11 \pm 3\%$, flow rate: $9 \pm 3\%$. Finally, we also found low rms ($5 \pm 2\%$) when comparing simulated pressure in the proximal aortic location against tonometric carotid pressure curves. In conclusion, this simple model performs similar to more complex models of the entire systemic arterial tree at a fraction of the cost, and could be of major usefulness in the non-invasive and local estimation of proximal biomechanical and hemodynamic indices.

1. Introduction

Both structural and functional alterations of large arteries, especially the aorta, occur with aging as well as with aggravating pathologic, genetic and environmental factors (Lakatta and Levy, 2003), resulting in arterial stiffening which has been associated with cardiovascular and cerebral morbi-mortality (Mitchell et al., 2010). One-dimensional (1D) computational fluid dynamics models, simulating parts or the entire systemic circulation, are widely used for studying arterial pressure and flow waves (Stergiopulos

et al., 1992; Olufsen et al., 2000; Segers and Verdonck, 2000; Sherwin et al., 2003; Steele et al., 2003; Wang and Parker, 2004; Bessens et al., 2007; Matthys et al., 2007; Alastruey et al., 2008; Bessens et al., 2008; Raymond et al., 2009, 2011, 2012). Indeed, they can provide insights into wave propagation and reflection, allowing for a better characterization of the arterial system and its interactions with target organs. Despite their approximations and sensitivity to changes in arterial caliber and distensibility, as well as to peripheral wave reflections, 1D models are computationally attractive, compared to the more accurate three-dimensional models. Valid questions are whether 1D models may be easily adapted to a specific subject, i.e. which features and parameters must be precisely tuned? and how to quantitatively validate model predictions? To date, when available, validations of 1D models including the aorta were performed against either *in vitro* (Segers and Verdonck, 2000; Matthys et al., 2007; Huberts et al., 2012) or *in vivo* (Stergiopulos et al., 1992; Olufsen et al., 2000; Steele et al., 2003; Raymond et al., 2009, 2011) data. Among these studies,
