Dynamic stock and flow diagram of model *New product adoption* (model from article by [John Sterman](#) 2001)

System dynamics is an approach to understanding the behaviour of complex systems over time. It deals with internal feedback loops and time delays that affect the behaviour of the entire system.^[1] What makes using system dynamics different from other approaches to studying complex systems is the use of feedback loops and stocks and flows. These elements help describe how even seemingly simple systems display baffling nonlinearity. **[**]**

Overview

System dynamics is a methodology and mathematical modeling technique for framing, understanding, and discussing complex issues and problems. Originally developed in the 1950s to help corporate managers improve their understanding of industrial processes, system dynamics is currently being used throughout the public and private sector for policy analysis and design.^[2]

Convenient GUI system dynamics software developed into user friendly versions by the 1990s and have been applied to diverse systems. SD models solve the problem of simultaneity (mutual causation) by updating all variables in small time increments with positive and negative feedbacks and time delays structuring the interactions and control. The best known SD model is probably the 1972 The Limits to Growth. This model forecast that exponential growth would lead to economic collapse during the 21st century under a wide variety of growth scenarios.

Stowell, Daune West, James G. Howell, 2012-12-06 As we approach the end of the 20th century we can look back upon the achievements that have been made in a variety of human endeavours with pride Enormous strides have been made to improve the quality of life of millions of people through the application of the scientific discoveries made during this and past centuries The 20th century will be remembered as much for the mass exploitation of scientific discovery as for the discoveries themselves The technological age has meant that the human being is able to contemplate activities which defy nature For example some of the work involved in the preparation of these proceedings has been done whilst travelling at over 500 miles per hour seven miles above the surface of the earth It is not difficult to conjecture about the effect that this relatively recent technology has had upon a number of systems Air transportation has provided a number of benefits including such disparate examples such as enabling holidays famine relief and the cross fertilisation of cultural practices from other lands Equally there have been undesirable effects such as enabling the means of mass destruction interference in other cultures and the speedy transportation of disease Moreover the physical presence of the aeroplane itself represents the consumption of fossil fuels a source of pollution and a change in the way think about life The view expressed here is of course the view of an inhabitant of the western world
