Biological Evolution , Intelligence Emerging Keith L. Downing, 2015-06-26 An investigation of intelligence as an emergent phenomenon integrating the perspectives of evolutionary biology neuroscience and artificial intelligence Emergence the formation of global patterns from solely local interactions is a frequent and fascinating theme in the scientific literature both popular and academic In this book Keith Downing undertakes a systematic investigation of the widespread if often vague claim that intelligence is an emergent phenomenon Downing focuses on neural networks both natural and artificial and how their adaptability in three time frames phylogenetic evolutionary ontogenetic developmental and epigenetic lifetime learning underlie the emergence of cognition Integrating the perspectives of evolutionary biology neuroscience and artificial intelligence Downing provides a series of concrete examples of neurocognitive emergence Doing so he offers a new motivation for the expanded use of bio inspired concepts in artificial intelligence AI in the subfield known as Bio AI One of Downing's central claims is that two key concepts from traditional AI search and representation are key to understanding emergent intelligence as well He first offers introductory chapters on five core concepts emergent phenomena formal search processes representational issues in Bio AI artificial neural networks ANNs and evolutionary algorithms EAs Intermediate chapters delve deeper into search representation and emergence in ANNs EAs and evolving brains Finally advanced chapters on evolving artificial neural networks and information theoretic approaches to assessing emergence in neural systems synthesize earlier topics to provide some perspective predictions and pointers for the future of Bio AI

Microbial genomics challenge Darwin Didier Raoult, Eugene V. Koonin, The 200th anniversary of Darwin's birthday was celebrated in 2009 making the concept of Darwinism even more popular than at the time it was originally proposed to the extent that it has acquired quasi religious status His theory revolves around a Tree of Life in which all living organisms are considered to have descended from a single ancestor and each node represents a common ancestor It comprises hierarchy and dichotomy which are typical characteristics of the post biblical 19th century vision Indeed according to post modern philosophy also called the French theory the majority of theories including scientific ones are based only on meta narratives expressing the influence of a culture at a given time Buddhism or Hinduism may have generated a very different story of evolution Our way of thinking about life and the way we describe evolution have changed radically in the 21st century due to the genomic revolution Comparative genome analyses have demonstrated that gene repertoires are characterized by plasticity and there is strong evidence that nearly all genes have been exchanged at some point Genomic data show that the genetic information of living organisms is inherited not only vertically but also laterally Lateral gene transfers were at first observed only in bacteria which contain genes originating from eukaryotes Archaea and viruses Such transfers were subsequently identified in all living organisms giant viruses have chimeric genomes and the human genome is a mosaic of genes with eukaryotic bacterial and viral origins We cannot identify a single common ancestor for the gene repertoire of any organism Furthermore a very

high proportion of genes have been newly created through gene fusion or degradation and others show no homology to sequences found in other species It is now clear that every living organism has a variety of ancestors while exchanges between species are intense and the creation of new genes is frequent and permanent in all living organisms Our current genomic knowledge contradicts the tree of life theory as established by Darwin Recent analyses have produced bushes rather than resolved trees with the structure of some parts remaining elusive It becomes more and more obvious that phylogenetic relationships are better described by forests and networks and that species evolution looks more like a rhizome The chimerism and mosaic structure of all living organisms through both non vertical inheritance and de novo creation can only be assimilated and described by a post Darwinist concept In this Research Topic we wish to highlight the influence of microbiology and genomics on our understanding of the complexity of gene repertoires and also demonstrate how current knowledge does not support Darwin's theory Microbiology has offered a great advance in the way we perceive life Evidence obtained from studies on bacterial and viral evolution lateral inheritance phylogenetic trees and biodiversity continues to challenge what constituted until recently an unimpeded dogma in biology
