The subject of earthquake engineering has been the focus of my teaching and research for many years Thus when Mario Paz the editor of this handbook asked me to write a Foreword I was interested and honored by his request Worldwide people are beginning to understand the severity of the danger to present and future generations caused by the destruction of the environment Earthquakes pose a similar threat thus the proper use of methods for earthquake resistant design and construction is vitally important for countries that are at high risk of being subjected to strong motion earthquakes Most seismic activity is the result of tectonic earthquakes Tectonic earthquakes are very special events in that although they occur frequently their probability of becoming natural hazards for a specific urban area is very small When a severe earthquake does occur near an urban area however its consequences are very large in terms of structural destruction and human suffering

Multilevel Solution Procedures for Structural Dynamics Eigenvalue Problems Tsanhuei Hwang,1991 Three multigrid algorithms are described that can solve the symmetric generalized eigenvalue problem encountered in structural dynamics First the multigrid algorithm for solving linear matrix equations is incorporated into the subspace iteration and block Lanczos methods to produce implicit subspace and Lanczos multigrid methods The nested iteration technique is adopted to produce the initial trial vectors Second the basic multigrid idea of fine mesh relaxation followed by a coarse mesh correction is explicitly applied to the eigenvalue problem to produce an explicit multigrid method The nested iteration technique is also used to provide information on the coarse meshes and to produce good initial approximations to the fine mesh eigensolutions Particular attention is paid to the implementation of these methods on vector and shared memory parallel supercomputers Several large scale problems are used to study the convergence behavior and computational performance of the methods The vector and parallel performance of the algorithms are tested using an Alliant FX 80 a Convex C240 and a Cray Y MP8 832 For example the first eigensolution of a plate problem with 3 151 875 degrees of freedom is solved in 670 seconds with 370 Mbytes of in core storage on the Convex In addition a computation rate of 950 Mflops and a speedup of 6 5 96 7% of parallelism are measured on the Cray
