

- **Bus :**

1. Bus topology is a network topology in which all the nodes are connected to a single cable known as a central cable or bus.
2. It acts as a shared communication medium, i.e., if any device wants to send the data to other devices, then it will send the data over the bus which in turn sends the data to all the attached devices.
3. Bus topology is useful for a small number of devices.
4. As if the bus is damaged then the whole network fails.

- **Mesh :**

1. Mesh topology is a network topology in which all the nodes are individually connected to other nodes.
2. It does not need any central switch or hub to control the connectivity among the nodes.
3. **Mesh topology is categorized into two parts: Fully connected mesh topology.** In this topology, all the nodes are connected to each other. Partially connected mesh topology. In this topology, all the nodes are not connected to each other.
4. It is robust as a failure in one cable will only disconnect the specified computer connected to this cable.
5. Mesh topology is rarely used as installation and configuration are difficult when connectivity gets more.
6. Cabling cost is high as it requires bulk wiring.

Topology Munkers Manual:

Handbook of Utility Theory Salvador Barbera, Peter J. Hammond, Christian Seidl, 1998 The standard rationality hypothesis implies that behaviour can be represented as the maximization of a suitably restricted utility function This hypothesis lies at the heart of a large body of recent work in economics of course but also in political science ethics and other major branches of social sciences Though the utility maximization hypothesis is venerable it remains an area of active research Moreover some fundamental conceptual problems remain unresolved or at best have resolutions that are too recent to have achieved widespread understanding among social scientists The main purpose of the Handbook of Utility Theory is to make recent developments in the area more accessible The editors selected a number of specific topics and invited contributions from researchers whose work had come to their attention Therefore the list of topics and contributions is largely the editors responsibility Each contributor's chapter has been refereed and revised according to the referees remarks This is the first volume of a two volume set with the second volume focusing on extensions of utility theory *Topology; a First Course* James R. Munkres, 1974 For a one or two semester introduction to topology at the senior or first year graduate level [Computer Graphics Through OpenGL®](#) Sumanta Guha, 2022-12-15 COMPREHENSIVE COVERAGE OF SHADERS THE PROGRAMMABLE PIPELINE AND WebGL From geometric primitives to animation to 3D modeling to lighting shading and texturing Computer Graphics Through OpenGL From Theory to Experiments is a comprehensive introduction to computer graphics which uses an active learning style to teach key concepts Equally emphasizing theory and practice the book provides an understanding not only of the principles of 3D computer graphics but also the use of the OpenGL Application Programming Interface API to code 3D scenes and animation including games and movies The undergraduate core of the book takes the student from zero knowledge of computer graphics to a mastery of the fundamental concepts with the ability to code applications using fourth generation OpenGL as well as using WebGL in order to publish to the web The remaining chapters explore more advanced topics including the structure of curves and surfaces applications of projective spaces and transformations and the implementation of graphics pipelines This book can be used for introductory undergraduate computer graphics courses over one to two semesters The careful exposition style attempting to explain each concept in the simplest terms possible should appeal to the self study student as well Features Covers the foundations of 3D computer graphics including animation visual techniques and 3D modeling Comprehensive coverage of OpenGL 4.x including the GLSL and vertex fragment tessellation and geometry shaders Comprehensive coverage of WebGL 2.0 Includes 440 programs and experiments Contains 700 exercises 100 worked examples and 650 four color illustrations Requires no previous knowledge of computer graphics Balances theory with programming practice using a hands on interactive approach to explain the underlying concepts **Artificial Mathematical Intelligence** Danny A. J. Gómez Ramírez, 2020-10-23 This volume discusses the theoretical foundations of a new inter and intra disciplinary meta research discipline which can be

succinctly called cognitive metamathematics with the ultimate goal of achieving a global instance of concrete Artificial Mathematical Intelligence AMI In other words AMI looks for the construction of an ideal global artificial agent being able to co solve interactively formal problems with a conceptual mathematical description in a human style way It first gives formal guidelines from the philosophical logical meta mathematical cognitive and computational points of view supporting the formal existence of such a global AMI framework examining how much of current mathematics can be completely generated by an interactive computer program and how close we are to constructing a machine that would be able to simulate the way a modern working mathematician handles solvable mathematical conjectures from a conceptual point of view The thesis that it is possible to meta model the intellectual job of a working mathematician is heuristically supported by the computational theory of mind which posits that the mind is in fact a computational system and by the meta fact that genuine mathematical proofs are in principle algorithmically verifiable at least theoretically The introduction to this volume provides then the grounding multifaceted principles of cognitive metamathematics and at the same time gives an overview of some of the most outstanding results in this direction keeping in mind that the main focus is human style proofs and not simply formal verification The first part of the book presents the new cognitive foundations of mathematics program dealing with the construction of formal refinements of seminal meta mathematical notions and facts The second develops positions and formalizations of a global taxonomy of classic and new cognitive abilities and computational tools allowing for calculation of formal conceptual blends are described In particular a new cognitive characterization of the Church Turing Thesis is presented In the last part classic and new results concerning the co generation of a vast amount of old and new mathematical concepts and the key parts of several standard proofs in Hilbert style deductive systems are shown as well filling explicitly a well known gap in the mechanization of mathematics concerning artificial conceptual generation
