challenged to be active The presentation of topics has been altered to include a new chapter which introduces the students to scientific thinking and shows that chemistry involves interesting and relevant topics The reorganization presents many core concepts in the first five chapters preparing students for later chapters In addition the author has added vignettes throughout the chapters referring to health technology the environment and society as well as to specific tools of direct use to students

Characterizing Mechanisms of Simultaneous Biological Nutrient Removal During Wastewater Treatment P. F. Strom, 2004-01-01 Simultaneous biological nutrient removal SBNR is the removal of nitrogen and or phosphorus in excess of that required for biomass synthesis in biological wastewater treatment systems where there are no defined anaerobic and or anoxic zones The hypothesis is that one or more of three mechanisms is responsible within individual systems variations in the bioreactor macroenvironment created by the mixing pattern gradients within the floc microenvironment and or novel microorganism activity Understanding of the mechanisms of SBNR can be expected to lead to improved efficiency and reliability in its application Preliminary work documented SBNR in 7 full scale Orbal™ closed loop bioreactors A batch assay demonstrated that novel microorganism activity was of little importance in SBNR at the three plants tested While the floc microenvironment likely plays an important role in nitrogen removal in such plants it cannot explain phosphorus removal A computational fluid dynamics CFD model was developed to elucidate the role of the bioreactor macroenvironment in SBNR This is the first reported application of CFD to activated sludge biological wastewater treatment Although the software and computational requirements limited model complexity it still simulated the creation of dissolved oxygen gradients within the system demonstrating that the anaerobic zones required for SBNR could occur
