boundaries and strong non linearities The various computational elements important for the prediction of complex fluid flows and interfacial transport are presented in this volume Practical applications presented in the form of illustrations and examples are emphasized as well as physical interpretation of the computed results The book is intended as a reference for researchers and graduate students in mechanical aerospace chemical and materials engineering Both macroscopic and microscopic but still continuum features are addressed In order to lay down a good foundation to facilitate discussion of more advanced techniques the book has been divided into three parts Part I presents the basic concepts of finite difference schemes for solving parabolic elliptic and hyperbolic partial differential equations Part II deals with issues related to computational modeling for fluid flow and transport phenomena Existing algorithms to solve the Navier Stokes equations can be generally classified as density based methods and pressure based methods In this book the pressure based method is emphasized Recent efforts to improve the performance of the pressure based algorithm both qualitatively and quantitatively are treated including formulation of the algorithm and its generalization to all flow speeds choice of coordinate system and primary velocity variables issues of grid layout open boundary treatment and the role of global mass conservation convection treatment and convergence Practical engineering applications including gas turbine combustor flow heat transfer and convection in high pressure discharge lamps thermal management under microgravity and flow through hydraulic turbines are also discussed Part III addresses the transport processes involving interfacial dynamics Specifically those influenced by phase change gravity and capillarity are emphasized and both the macroscopic and morphological microscopic scales are presented Basic concepts of interface capillarity and phase change processes are summarized to help clarify physical mechanisms followed by a discussion of recent developments in computational modeling Numerical solutions are also discussed to illustrate the salient features of practical engineering applications Fundamental features of interfacial dynamics have also been illustrated in the form of case studies to demonstrate the interplay between fluid and thermal transport of macroscopic scales and their interaction with interfacial transport
