Tsui, 2007-11-13 There are few situations in anesthesia where precise anatomic location is more important than in regional anesthesia But of course any anesthesiologist who performs regional on a regular basis is fully aware of the frustration of attempting to locate nerves on a trial and error basis Ultrasound imaging now enables us to visualize nerves and this exciting technology offers several distinct benefits over conventional nerve locating techniques The Atlas of Ultrasound and Nerve Stimulation Guided Regional Anesthesia illustrates how to use ultrasound technology and nerve stimulation techniques to achieve consistently good results Throughout the book ultrasound images are correlated with MRI images to enhance anatomic identification In addition peripheral nerve block techniques for upper and lower extremities and the trunk are demonstrated step by step With the luxury of being able to actually see the target nerve and the course of the needle as it approaches that nerve anesthesiologists can now perform regional anesthesia with much greater accuracy This approach allows the anesthesiologist to conduct regional anesthesia with much greater confidence and efficiency and in doing so the

patient is the ultimate beneficiary in terms of success and safety The book features well illustrated comparisons of anatomic drawings cadaveric images and ultrasound and MRI images Also Detailed description of relevant anatomy followed by a clinical description of performing ultrasound imaging and subsequent blockade of target nerves Side by side comparison of labeled and unlabeled ultrasound images simulating the clinician s experience in everyday practice Both common and alternative approaches are discussed in detail each discussion calling upon the wisdom of experts in the field of regional anesthesia Clinical pearls about needle adjustment included in troubleshooting tables in the nerve stimulation sections

Longnecker,2012-05-23 Accompanying DVD ROM contains an image gallery and video clips of key procedures P 4 of cover *Education and Training in Ultrasound-Guided Regional Anaesthesia* Alwin Hooi Hock Chuan,2016 The concept of using Doppler ultrasound to guide regional anaesthesia performance was first described in 1978 It was however the introduction into clinical practice in the last 15 years of portable affordable high resolution bedside ultrasound machines that has revolutionised the practice of regional anaesthesia Visualising anatomical structures and guiding a needle to target structures under direct ultrasound guidance is now considered best practice Ultrasound guided regional anaesthesia compared to traditional nerve localisation techniques such as nerve stimulation and paraesthesia has been shown to improve efficacy and efficiency and reduce the risk of local anaesthesia systemic toxicity and pneumothorax Ultrasound has allowed the introduction of novel approaches to thoracoabdominal and neuraxial blocks This imaging technique is increasingly being used in pain medicine complementing and in some instances replacing the image intensifier

and computed tomography guided interventional procedures In contrast novices attempting ultrasound guided regional anaesthesia exhibit suboptimal behaviours including visual spatial disorientation rigid procedural thinking and needle manipulation without confirmation of positioning The root problem is that teaching of regional anaesthesia is variable in quality and is non systematic The reasons are complex but include variability in supervision worsening production pressures in busy tertiary hospitals curtailing time for teaching shortening of trainee training times and resistance by clinicians for new techniques Compounding these problems was a lack of validated reliable and objective tools to assess ultrasound guided regional anaesthesia performance This is addressed in the first four studies of this thesis Studies 1 and 2 evaluated the psychometric properties of the direct observation of procedural skills assessment tool used in the current training curriculum of the Australian and New Zealand College of Anaesthetists I found that inter assessor reliability is poor which has important consequences as this tool is used for trainee assessment and structured feedback Study 3 evaluated a checklist and global rating scale designed specifically for ultrasound guided regional anaesthesia This tool showed good construct validity and that a deconstructed itemised checklist is useful for teaching complex skills such as regional anaesthesia Study 4 described the design creation and validation of the Regional Anaesthesia Procedural Skills RAPS assessment tool RAPS has evidence for face validity construct validity test retest reliability external reliability and feasibility as an assessment tool for all regional anaesthesia blocks including ultrasound guided techniques The RAPS tool can thus be used for clinical assessment of trainees as well as a reliable measure of performance in participants in education research The next two studies investigated factors by which training in ultrasound guided regional anaesthesia can be improved Study 5 was a randomised controlled trial comparing whether fresh frozen human cadavers were superior to meat based models for teaching ultrasound guided regional anaesthesia I found that while face validity and qualitative satisfaction was superior for cadavers there was no quantitative difference in efficacy efficiency or errors committed in a part task technical skills test Study 6 was an exploratory study in whether visuospatial ability influences sonography performance In novices performing brachial plexus sonography and reliant only on discovery learning three visuospatial factors were found to be influential spatial visualisation spatial relations and speed of closure The standardised visuospatial test battery can thus identify novices who will likely struggle with sonography This opens an avenue for training tailored to an individual's strengths and weaknesses
