

1. What is primitive neuroectodermal tumor (PNET)?
 - PNET is a type of cancer that arises from cells in the central nervous system, which includes the brain and spinal cord. These tumors are typically aggressive and can spread to other parts of the body.
2. Who is most likely to develop PNET?
 - PNETs are most commonly found in children and young adults, although they can occur at any age.
3. Where do PNETs typically occur?
 - PNETs can occur anywhere in the central nervous system, including the brain and spinal cord.
4. What are the symptoms of PNET?
 - Symptoms of PNET may include headache, nausea and vomiting, weakness or numbness in the arms or legs, difficulty with balance or coordination, and seizures. In some cases, the tumor may cause changes in vision or hearing, or it may affect the way a person speaks or understands language.
5. How is PNET diagnosed?
 - PNET is typically diagnosed through a combination of imaging tests, such as CT scans or MRIs, and a biopsy, in which a small sample of tissue is removed and examined under a microscope.
6. What are the treatment options for PNET?
 - Treatment options for PNET may include surgery, radiation therapy, and chemotherapy. The specific treatment plan will depend on the size and location of the tumor, as well as the age and overall health of the patient.
7. What is the prognosis for PNET?
 - The prognosis for PNET is generally poor, as these tumors are typically aggressive and can spread to other parts of the body. However, with appropriate treatment, some patients may experience significant improvement in their symptoms and a good quality of life. It is important for patients to continue to follow up with their healthcare team and undergo regular imaging tests to ensure that the tumor has not returned or grown.

Thanks to the development and deployment of whole slide imaging technology in pathology glass slides previously observed under a traditional microscope are now scanned and converted to digital images which are more beneficial for remote access portability and ease of sharing to facilitate telepathology More importantly digitization of glass slides paves the way towards the wide use of artificial intelligence AI tools including machine deep learning algorithms resulting in improved diagnostic accuracy In the past decade a large number of studies have demonstrated the remarkable success of AI particularly deep learning in digital pathology such as tumor region identification metastasis detection and patient prognosis Differing from handcrafted feature based approaches that take advantage of domain knowledge to delineate specific morphological measurements e g nuclei shape and size and tissue texture in the images as features for training deep learning is a paradigm of feature learning entirely driven by the image data and or labels Herein the use of deep learning in pathological diagnosis can not only handle increased workloads and expertise shortages but also obviate subjective diagnosis from pathologists Yet there remain many scientific and technological challenges associated with the efficiency of deep learning algorithms for use in clinical practice For example deep learning requires a sufficient amount of training data for generalization and suffers from a lack of feature interpretability The overarching goal of this special issue is to highlight novel research accomplishments and directions related to advanced AI methodology development and applications in digital pathology
