

Chapter 4: Financial Markets and Net Present Value: First Principles of Finance

Questions and Problems:

- 4.1 Potential consumption next year is: $\$108,000 - (\$135,000 - \$85,000) \times (1.07) = \$54,500$
In order to consume \$135,000 this year Jack will borrow \$50,000 and pay \$53,500 (\$50,000 principal and \$3,500 interest) next year, leaving him \$54,500 potential consumption next year.
- 4.3 a. Ben's consumption next year = $(\$4,000 - \$2,000 - \$1,000) \times (1 + r) + \$3,000 = \$4,150$
Solving these equations gives $r = 0.15$ or 15%
- b. If the interest rate increases, Ben's consumption increases for this year. With a consumption of \$4,150 next year, Ben will have to invest less than \$2,000 in the project and lend out less than \$1,000 this year, so that he has more than \$1,000 to consume this year. Ben is better off than before the interest rises.
- 4.5 There would be too much borrowing and there would be insufficient lending at 4%. The borrowers would have to be given limited access to the market. This would also be an irresistible arbitrage opportunity that could not last long and a new equilibrium would be set, this would occur if arbitrageurs borrow at 4% and then lend at 5.3%.
- 4.7 a. The market interest rate, r , is such that: $\$65,000 = \$97,500/(1 + r)$
 $r = (97,500/65,000) - 1 = 0.5 = 50\%$
- b. Investment in productive asset = $\$54,300 - \$30,200 = \$24,100$
Investment in financial assets = $\$54,300$ (how much he has today) – $\$24,100$ (investment cost above) – $\$25,000$ (consumption today) = $\$5,200$
- c. $NPV = -\$24,100$ (investment cost) + $(\$52,200 - \$16,050)/1.5 = \$0$
- 4.9 a. Ryan can consume \$3,000 $[(115,000 - 90,000) - 20,000 \times 1.1]$ more assuming that the investment opportunity is undertaken.
- b. $NPV = -\$20,000 + \$25,000/1.1 = \$2,727$.

Accompanying CD ROM contains a chapter on engineering statistics and probability by N Bali M Goyal and C Watkins CD ROM label *Ordinary Differential Equations* William A. Adkins, Mark G. Davidson, 2012-07-01 Unlike most texts in differential equations this textbook gives an early presentation of the Laplace transform which is then used to motivate and develop many of the remaining differential equation concepts for which it is particularly well suited For example the standard solution methods for constant coefficient linear differential equations are immediate and simplified and solution methods for constant coefficient systems are streamlined By introducing the Laplace transform early in the text students become proficient in its use while at the same time learning the standard topics in differential equations The text also includes proofs of several important theorems that are not usually given in introductory texts These include a proof of the injectivity of the Laplace transform and a proof of the existence and uniqueness theorem for linear constant coefficient differential equations Along with its unique traits this text contains all the topics needed for a standard three or four hour sophomore level differential equations course for students majoring in science or engineering These topics include first order differential equations general linear differential equations with constant coefficients second order linear differential equations with variable coefficients power series methods and linear systems of differential equations It is assumed that the reader has had the equivalent of a one year course in college calculus *Advanced Engineering Mathematics* Dennis G. Zill, 2020-12-01 This package includes the printed hardcover book and access to the Navigate 2 Companion Website The seventh edition of Advanced Engineering Mathematics provides learners with a modern and comprehensive compendium of topics that are most often covered in courses in engineering mathematics and is extremely flexible to meet the unique needs of courses ranging
