Wood-framed Shear Wall Construction Thor Matteson, 2011 Wood framed shear walls are a crucial part of modern residential and small commercial buildings Shear walls resist wind and earthquake forces to protect buildings from collapse

This book explains the engineering principles involved with shear wall design and proper construction. It is written in non-technical language intended for carpenters and builders. The basic unchanging physical principles are explained with illustrated examples. This guide goes into detail that no other book on the subject even approaches. Over 180 pages and 150 color photos and illustrations show actual construction conditions and examples of proper and improper installations. It is extensively indexed for quick reference to specific topics. A detailed two-page illustration shows many basic requirements in graphical format for easy guidance. Specific sections of the International Building Code and International Residential Code are referenced where appropriate. This edition includes a new chapter on earthquake strengthening methods for existing buildings. This chapter was itself expanded into a completely separate book over 250 pages titled *Earthquake Strengthening for Vulnerable Homes*. The book is intended mostly for carpenters and builders but engineers and building inspectors also find the information very useful. Engineers may learn methods to make their shear wall designs more efficient and effective. An extensive inspection checklist over 70 items is included. This checklist is the basis for Special Inspection Guidelines for Wood Frame Construction currently under development by the Structural Engineers Association of Northern California.

Building Design for Wind Forces: A Guide to ASCE 7-16 Standards Rima Taher, 2018-08-24 Expert coverage of ASCE 7-16 compliant wind resistant engineering methods for safer, sounder low-rise and standard multi-story buildings. Using the hands-on information contained in this comprehensive engineering guide, you will be able to design and construct safer buildings that will better withstand extreme wind forces. Written by a recognized structural design expert, the book explains the general concepts and principles involved in the design of buildings and structures for wind forces. Structural systems used to resist wind forces are outlined and explained in the context of both low-rise and high-rise buildings. *Building Design for Wind Forces* provides easy-to-follow summaries of complex ASCE 7-16 wind load provisions and shows how to apply the corresponding design procedures using practical examples. A detailed discussion of typical structural damage caused by extreme wind events such as hurricanes and tornadoes is presented along with design recommendations. Current wind engineering activities and recent research developments are discussed, and a general overview of wind tunnel procedures and an introduction to the concept of database-assisted design (DAD) is provided. *Building Design for Wind Forces* covers wind forces and wind effects on buildings and structures; wind load provisions of the ASCE 7-16 standard; damage to structures caused by extreme wind events; wind engineering activities and research trends; structural systems for lateral loads; tall buildings; wind design procedures and wind load parameters; wind loads on the Main Wind Force Resisting System (MWFRS); wind loads on components and cladding; wind loads on building appurtenances and other structures; wind tunnels and the wind tunnel procedure; database-assisted design (DAD).

Higher Capacity Cold-formed Steel Sheathed and Framed Shear Walls for Mid-rise Buildings

Veronica Santos,2018 The use of cold formed steel CFS for seismic force resisting systems SFRRS including shear walls has increased throughout the years However the design provisions for CFS sheathed and framed shear walls available in the North American CFS standards AISI S400 and AISI S240 are limited by the shear walls sheathing and framing thicknesses Design guidelines for CFS sheathed and framed shear walls for the purpose of mid rise construction up to 5 storeys are still absent from the standards The main objective of this research program was to develop a design procedure for CFS sheathed and framed shear walls to achieve higher capacity and ductility to resist the higher forces experienced in mid rise construction The developed design procedure is proposed to be included in the provisions of the AISI S240 Standard and AISI S400 Standard The design procedure was developed by determining the shear strength of full scale shear wall specimens built and tested at McGill University under monotonic and cyclic loading protocols A total of 31 specimens with varying building parameters were constructed using thicker sheathing and framing members than what is currently available for design The specimens were built using two new shear wall configurations double sheathed and centre sheathed to address out of plane forces experienced by shear walls tested in previous research programs The centre sheathed shear wall configuration with a confined and concentrically placed sheathing panel reached a shear resistance four times higher than the design values tabulated in the current standards The ductility of these CFS shear walls was also significantly improved A preliminary equation based nominal shear strength prediction method has been developed for the centre sheathed shear walls the method reflects the shear wall s different configuration and superior behaviour Following the test data analysis preliminary design parameters for Limit States Design LSD used in Canada and for Load and Resistance Factor Design LRFD used in the USA and Mexico were determined including the load resistance factor ϕ and the factor of safety In addition capacity based design parameters were determined for seismic design in Canada These parameters included the test based seismic performance factors R_d and R_o which were found to be 2.8 and 1.5 respectively The superior performance of the centre sheathed configuration showed its promising potential as a new design option for higher capacity CFS shear walls However before a potential implementation into mid rise construction further research is needed in order for a complete design procedure to be developed
