E. F. Matthews, 2018-01-18 The overall aim of this volume is to review critically the current state of and future prospects for developments in viral taxonomy Most of the contributors to this volume have had substantial period of service on the Executive Committee and sub committees of the International Committee on Taxonomy of Viruses ICTV *The Life of a Virus* Angela N. H. Creager, 2002 We normally think of viruses in terms of the devastating diseases they cause from smallpox to AIDS But in *The Life of a Virus* Angela N H Creager introduces us to a plant virus that has taught us much of what we know about all viruses including the lethal ones and that also played a crucial role in the development of molecular biology Focusing on the tobacco mosaic virus TMV research conducted in Nobel

laureate Wendell Stanley's lab Creager argues that TMV served as a model system for virology and molecular biology much as the fruit fly and laboratory mouse have for genetics and cancer research. She examines how the experimental techniques and instruments Stanley and his colleagues developed for studying TMV were generalized not just to other labs working on TMV but also to research on other diseases such as poliomyelitis and influenza and to studies of genes and cell organelles. The great success of research on TMV also helped justify increased spending on biomedical research in the postwar years partly through the National Foundation for Infantile Paralysis's March of Dimes, a funding priority that has continued to this day.

Environmental Microbiology Research Trends George V. Kurladze, 2007. Virus Discovery by Metagenomics: The (Im)possibilities Bas E. Dutilh, Alejandro Reyes, Richard J. Hall, Katrine L. Whiteson, 2017-10-25. Since the late 1800s the discovery of new viruses was a gradual process. Viruses were described one by one using a suite of techniques such as electron microscopy and viral culture. Investigators were usually interested in a disease state within an organism, and expeditions in viral ecology were rare. The advent of metagenomics, using high throughput sequencing, has revolutionized not only the rate of virus discovery but also the nature of the discoveries. For example, the viral ecology and etiology of many human diseases are being characterized, non-pathogenic viral commensals are ubiquitous, and the description of environmental viromes is making progress. This *Frontiers in Virology Research* Topic showcases how metagenomic and bioinformatic approaches have been combined to discover, classify, and characterize novel viruses.
