On Systems Analysis and Simulation of Ecological Processes with Examples in CSMP and FORTRAN P.A. Leffelaar, 2012-12-06 A system may be studied by distinguishing its major components characterizing the changes in them by differential equations that form their simplified

representations and then interconnecting these representations to obtain a model of the original system. Developing the model is the systems synthesis phase. The behaviour of the model may now be studied and compared with experimental results obtained from the system. This research method is called systems analysis and simulation. Systems analysis and simulation can serve to make predictions to improve the insight in systems and to test knowledge on consistency and completeness. Predictive models are rare in ecology simply because the underlying processes which form the basis of the models are seldom well known. A successful example of a predictive model was the work of van Keulen 1975. He showed that under semi arid conditions where water is the main factor controlling primary production the simulation technique could predict the production of natural grasslands. Fair predictions could also be made for the Sahelian pastures. Penning de Vries Djiteye 1982. Predictive models of populations of different pest and disease organisms are being used in biological control systems. Zadoks et al 1984.

Methods and Concepts for Designing and Validating Smart Grid Systems Thomas I. Strasser, Sebastian Rohjans, Graeme M. Burt, 2019-11-20 Energy efficiency and low carbon technologies are key contributors to curtailing the emission of greenhouse gases that continue to cause global warming The efforts to reduce greenhouse gas emissions also strongly affect electrical power systems Renewable sources storage systems and flexible loads provide new system controls but power system operators and utilities have to deal with their fluctuating nature limited storage capabilities and typically higher infrastructure complexity with a growing number of heterogeneous components In addition to the technological change of new components the liberalization of energy markets and new regulatory rules bring contextual change that necessitates the restructuring of the design and operation of future energy systems Sophisticated component design methods intelligent information and communication architectures automation and control concepts new and advanced markets as well as proper standards are necessary in order to manage the higher complexity of such intelligent power systems that form smart grids Due to the considerably higher complexity of such cyber physical energy systems constituting the power system automation protection information and communication technology ICT and system services it is expected that the design and validation of smart grid configurations will play a major role in future technology and system developments However an integrated approach for the design and evaluation of smart grid configurations incorporating these diverse constituent parts remains elusive The currently available validation approaches focus mainly on component oriented methods In order to guarantee a sustainable affordable and secure supply of electricity through the transition to a future smart grid with considerably higher complexity and innovation new design validation and testing methods appropriate for cyber physical systems are required Therefore this book summarizes recent research results and developments related to the design and validation of smart grid systems
