The Story of Proof John

Stillwell, 2022-11-15 How the concept of proof has enabled the creation of mathematical knowledge. The Story of Proof investigates the evolution of the concept of proof, one of the most significant and defining features of mathematical thought through critical episodes in its history. From the Pythagorean theorem to modern times and across all major mathematical disciplines, John Stillwell demonstrates that proof is a mathematically vital concept inspiring innovation and playing a critical role in generating knowledge. Stillwell begins with Euclid and his influence on the development of geometry and its methods of proof, followed by algebra which began as a self-contained discipline but later came to rival geometry in its mathematical impact. In particular, the infinite processes of calculus were at first viewed as infinitesimal algebra and calculus became an arena for algebraic computational proofs rather than axiomatic proofs in the style of Euclid. Stillwell proceeds to the areas of number theory, non-Euclidean geometry, topology and logic and peers into the deep chasm between natural number arithmetic and the real numbers. In its depths, Cantor, Gödel, Turing and others found that the concept of proof is ultimately part of arithmetic. This startling fact imposes fundamental limits on what theorems can be proved and what problems can be solved. Shedding light on the workings of mathematics at its most fundamental levels, The Story of Proof offers a compelling new perspective on the field's power and progress.

Papers on Group Theory and Topology Max Dehn, 2012-12-06 The work of Max Dehn 1878 1952 has been quietly influential in mathematics since the beginning of the 20th century In 1900 he became the first to solve one of the famous Hilbert problems the third on the decomposition of polyhedra in 1907 he collaborated with Heegaard to produce the first survey of topology and in 1910 he began publishing his own investigations in topology and combinatorial group theory His influence is apparent in the terms Dehn s algorithm Dehn s lemma and Dehn surgery and Dehnsche Gruppenbilder generally known in English as Cayley diagrams but direct access to his work has been difficult No edition of his works has been produced and some of his most important results were never published at least not by him The present volume is a modest attempt to bring Dehn s work to a wider audience particularly topologists and group theorists curious about the origins of their subject and interested in mining the sources for new ideas It consists of English translations of eight works five of Dehn s major papers in topology and combinatorial group theory and three unpublished works which illuminate the published papers and contain some results not available elsewhere In addition I have written a short introduction to each work summarising its contents and trying to establish its place among related works of Dehn and others and I have added an appendix on the Dehn Nielsen theorem often known simply as Nielsen s theorem

The Bounded and Precise Word Problems for Presentations of Groups S. V. Ivanov, 2020-05-13 The author introduces and studies the bounded word problem and the precise word problem for groups given by means of generators and defining relations For example for every finitely presented group the bounded word problem is in NP i.e. it can be solved in nondeterministic polynomial time and the precise word problem is in PSPACE i.e. it can be solved in polynomial space The main technical result of the paper states that for certain finite presentations of groups which include the Baumslag Solitar one relator groups and free products of cyclic groups the bounded word problem and the precise word problem can be solved in polylogarithmic space As consequences of developed techniques that can be described as calculus of brackets the author obtains polylogarithmic space bounds for the computational complexity of the diagram problem for free groups for the width problem for elements of free groups and for

computation of the area defined by polygonal singular closed curves in the plane The author also obtains polynomial time bounds for these problems

Max Dehn Jemma Lorenat, John McCleary, Volker R. Remmert, David E. Rowe, Marjorie Senechal, 2024-10-04 Max Dehn 1878 1952 is known to mathematicians today for his seminal contributions to geometry and topology Dehn surgery Dehn twists the Dehn invariant etc He is also remembered as the first mathematician to solve one of Hilbert's famous problems However Dehn's influence as a scholar and teacher extended far beyond his mathematics Dehn also lived a remarkable life described in this book in three phases The first phase focuses on his early career as one of David Hilbert's most gifted students The second after World War I treats his time in Frankfurt where he led an intimate community of mathematicians in explorations of historical texts The final phase after 1938 concerns his flight from Nazi Germany to Scandinavia and eventually to the United States where after various teaching experiences the Dehns settled at iconic Black Mountain College This book is a collection of essays written by mathematicians and historians of art and science It treats Dehn's mathematics and its influence his journeys and his remarkable engagement in history and the arts A great deal of the information found in this book has never before been published

Invariants And Pictures: Low-dimensional Topology And Combinatorial Group Theory Vassily Olegovich Manturov, Denis Fedoseev, Seongjeong Kim, Igor Nikonov, 2020-04-22 This book contains an in depth overview of the current state of the recently emerged and rapidly growing theory of G_n groups picture valued invariants and braids for arbitrary manifolds Equivalence relations arising in low dimensional topology and combinatorial group theory inevitably lead to the study of invariants and good invariants should be strong and apparent An interesting case of such invariants is picture valued invariants whose values are not algebraic objects but geometrical constructions like graphs or polyhedra In 2015 V O Manturov defined a two parametric family of groups G_n and formulated the following principle if dynamical systems describing a motion of n particles possess a nice codimension 1 property governed by exactly k particles then these dynamical systems possess topological invariants valued in G_n The book is devoted to various realisations and generalisations of this principle in the broad sense The groups G_n have many epimorphisms onto free products of cyclic groups hence invariants constructed from them are powerful enough and easy to compare However this construction does not work when we try to deal with points on a 2 surface since there may be infinitely many geodesics passing through two points That leads to the notion of another family of groups n_k which give rise to braids on arbitrary manifolds yielding invariants of arbitrary manifolds
