Abstract: This paper presents a new method for the automatic detection of the onset of a seizure in EEG signals. The method is based on the analysis of the power spectrum of the EEG signal. The power spectrum is calculated for each time window of the EEG signal. The onset of a seizure is detected when the power spectrum shows a significant increase in the power of the low frequency components. The method is evaluated using a set of EEG signals recorded from patients with epilepsy. The results show that the method is able to detect the onset of a seizure with a high degree of accuracy.
