The Formation of Igneous Rocks

Scenario

Scenario: A team of geologists is conducting a research project on a newly discovered volcanic island. They have observed various igneous rocks in different locations and want to understand the processes that led to their formation. The team collects samples and notes that some rocks are found beneath the surface, while others are located near the top of the island.

Background Information

Background information: Igneous rocks are formed from the solidification and cooling of molten rock material. This material is known as magma when it is beneath the Earth's surface and lava when it erupts onto the surface. Igneous rocks are classified into two main types based on where they form: intrusive (plutonic) and extrusive (volcanic). Intrusive rocks, such as granite, are formed deep beneath the surface.
